1. About Mobile Shop

Mobile Shop is software for running a mobile phone shop in Pakistan. It keeps your stock, your sales, your purchases, your udhaar khata, your repairs and your day's hisaab in one place, on your phone or your computer.

It was made together with real shopkeepers. The buttons are big, the steps are short, and the app does the adding and subtracting for you. You do not need to know anything about computers to use it.

Who it is for

- Shops that buy and sell **new box-pack phones** from dealers.
- Shops that buy and sell **used phones** from walk-in customers.
- Shops that also sell **tablets, smart watches and accessories** (chargers, cables, covers, glass, earphones, power banks).
- Shops that do **repairs**, in the shop or through an outside lab.
- The **owner**, who wants to see the whole business from home, and the **staff**, who work at the counter.

A few shop words used in this manual

Word	Meaning
Udhaar	Credit. The customer takes the phone now and pays later, or you take a phone from a dealer and pay him later.
Khata	The running account of one person: what he owes you, or what you owe him.
Galla	The cash drawer at the counter.
Hisaab	The day's account: what came in, what went out, what is left.
Qist	An installment. The customer pays an advance and the rest month by month.
Len-den	Money given or taken with no bill, for example a loan to a neighbour shopkeeper.
PTA	The Pakistan Telecommunication Authority. A **PTA approved** phone works on a Pakistani SIM for good; a **Non-PTA** phone works only for a limited time; a **JV** phone is a patched, unofficial approval.

Word	Meaning
IMEI	The 15-digit number that identifies a phone. Dial `*#06#` to see it, or read it from the box.
CNIC	The national identity card. Its 13-digit number is used to check who sold you a used phone.

What makes it different

- **An Android app.** Install it on the shop phone. The camera scans the IMEI on the box and reads the CNIC card for you. You can log in with a fingerprint.
- **Online and offline.** Open it in any browser, on a phone, a laptop or a desktop, and see your shop live from home. If the internet goes, a sale is saved on the phone and sent as soon as the connection is back. A shop with no internet at all can run it on one Windows PC.
- **Used-phone verification.** Before you buy a used phone, the app helps you check the seller's CNIC, take photos, check eGadget and PTA, and check that no iCloud or Google lock is left on it. A phone whose check is still pending cannot be sold by mistake.
- **The seller's signed consent.** The seller signs the declaration on the screen with his finger. His signature, his CNIC photo and the phone's IMEI are kept together, and the signature is printed on the declaration.
- **Your language.** The whole app works in **Urdu**, **Roman Urdu** or **English**, one language at a time. Bills and WhatsApp messages follow the shop's language.
- **A "?" on everything.** Every field, card and tab has a small question mark. Tap it to read what it means, with a shop example in rupees.
- **Roles.** The owner decides who may do what. A salesman can sell and buy but never sees buying prices or profit.
- **A full shop audit.** Every rupee and every phone can be traced back to the bill, the person and the time. Nothing is ever deleted; a mistake is corrected with a new entry, and the old one stays visible.

Modules at a glance

Module	What it does
Sell	Cash, udhaar, installment and part-paid sales, with receipts on print, PDF and WhatsApp.
Add stock	Buy phones, tablets, watches and accessories from a dealer or a customer.
ID check	CNIC, photos, eGadget, PTA, lock checks and the seller's signature for used phones.
Udhaar	Who owes you and whom you owe, with WhatsApp reminders.

Module	What it does
Hisaab	Today's sales, cash in hand, money on udhaar, expenses and profit.
Stock	Every phone in the shop, its worth, its full history and a sticker with a barcode.
Return and Exchange	A customer brings a phone back, or swaps an old phone for a new one.
Repair	Job cards, repair stickers and repair labs.
Accessories	Counted items, bought by piece, dozen or box, sold by piece.
Installments (qist)	Advance, monthly amounts, guarantor and late reminders.
Loans (amanat)	Phones lent to or borrowed from other shops.
Reports and Shop audit	Profit, best sellers, prices, staff activity, and the whole business for any period.
Staff	Owner, manager, salesman and technician, with attendance (hazri).

> **Note:** Your provider may switch some modules on or off for your shop. If you do not see a button described here, ask the provider.

2. Getting the app

You can use Mobile Shop in several ways. Your data is the same in all of them, because it lives safely on the server, not on one phone.

In the browser

1. Open **Chrome** on your phone or computer.
2. Go to `https://mobileshop.oopsolutions.com`.
3. Log in (see chapter 3).

This is the quickest way to start. It also works on a laptop, where the jobs appear as a side menu and you can use keyboard keys: **F2** Sell, **F3** Add stock, **F4** Udhaar, **F6** Stock, **F7** Repair, **F8** Expense, **F9** Return.

Install it as an app from Chrome

1. Open `https://mobileshop.oopsolutions.com` in Chrome on your Android phone.
2. Tap Chrome's menu (the three dots, top right).
3. Tap **Install app** (on some phones it says **Add to Home screen**).
4. Tap **Install**. A **Mobile Shop** icon appears on your home screen. Open it like any other app.

The Android app (APK file)

The Android app gives you the phone's camera for scanning and the phone's fingerprint for logging in.

1. On the Android phone, open `https://mobileshop.oopsolutions.com/app.apk`. You can also tap **Download the Android app** on the login page, or your provider may send you the file on WhatsApp.
2. Open the downloaded file.
3. The first time, Android may say this app is not allowed to install apps. Tap **Settings**, switch on **Allow from this source**, then go back.
4. Tap **Install**, then **Open**.

When a newer version comes, install it over the old one. Your data stays.

> **Tip:** In the Android app, **Print** and **Download** open in Chrome. Choose your printer or **Save as PDF**, then come back to the app with the back button.

Working without internet

The internet in the market is not always good. Mobile Shop is ready for that.

- When the connection drops, a bar says: *"No internet. Sales, stock, payments and expenses are saved on this phone and sent when the connection returns."*
- Keep working. Each entry you make says *"Saved on this phone. It will be sent when the internet is back."*
- A small counter shows how many entries are waiting, for example **2 waiting to be sent**. Tap it to see the list **Waiting to be sent**.
- When the internet comes back, the app sends them in the same order, once each. No sale is lost and no sale is sent twice.

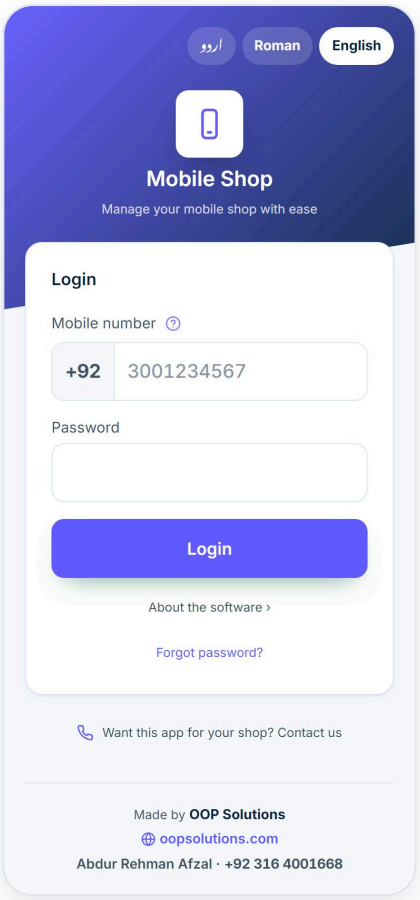

> **Important:** Do not delete the app or clear its data while entries are still waiting. They have not reached the server yet.

On one Windows PC with no internet at all

For a shop with no reliable internet, the provider can install **Mobile Shop** on one Windows computer. You open it from the Desktop and work as usual. Everything is kept on that PC, and the small icon near the clock has **Backup now** to make a dated copy. Ask your provider to set this up for you.

3. Logging in

Your shop is opened by **OOP Solutions**, the maker of the software. There is no "create shop" button for you to press. When your shop is ready you receive a **mobile number** and a **password** on WhatsApp. If you want the app for another shop, tap **Want this app for your shop? Contact us** on the login page.

Picture 1: The login page

Log in with your password

1. At the top, pick your language: **اردو**, **Roman** or **English**.
2. In **Mobile number**, **+92** is already written. Type the rest of your number without the first 0. For `0300 1234567`, type `3001234567`.
3. Type your **Password**.
4. Tap **Login**.

> **Tip:** Pasting a number such as `0300...` or `+92300...` also works. The app cleans it up for you.

Forgot password

1. Under the login form, tap **Forgot password?**

2. Check that your mobile number is right.
3. Tap **Send code on WhatsApp**. A 6-digit code arrives on that number.
4. Type the code and tap **Confirm code**.
5. Choose a **New password**. You are logged in.

The code works for 10 minutes. If WhatsApp is not available, send a request instead. A staff member's request goes to the shop owner, who sets a new password in **More** → **Staff** → **the person** → **New password**. The owner's own request goes to the software provider.

Quick PIN

A PIN is faster than a password on your own phone.

1. Log in once with your password.
2. Tap **More** → **Set quick PIN**.
3. Type your password, then a 4 to 6 digit PIN, for example `4821`.
4. Tap **Save**.

Next time this phone opens the **Enter your PIN** screen with your name. Tap the digits and you are in.

- **Forgot PIN? Use password** takes you back to the password screen.
- **Use another account** lets a different staff member log in on the same phone.

> **Tip:** The owner's PIN is also used to approve a sale below the asking price on the spot, when the shop's price rule asks for it (see chapter 8).

Fingerprint login

1. Log in once with your password.
2. Tap **More** → **Fingerprint login** → **Turn on for this phone**.
3. Touch the fingerprint sensor.

Next time the login page shows **Log in with fingerprint**. One touch and you are in. On a laptop it can use the face or Windows Hello of that device. Your fingerprint never leaves the phone.

- The **owner** can always use it. Staff can use it only after the owner switches on, in **Settings**, that staff may log in with their fingerprint.
- The same card lists every phone that can log in this way. **Remove** stops one at once.

> **Important:** On a shared shop phone, any finger saved in the phone's settings can open your account. Turn fingerprint login on only on your own phone.

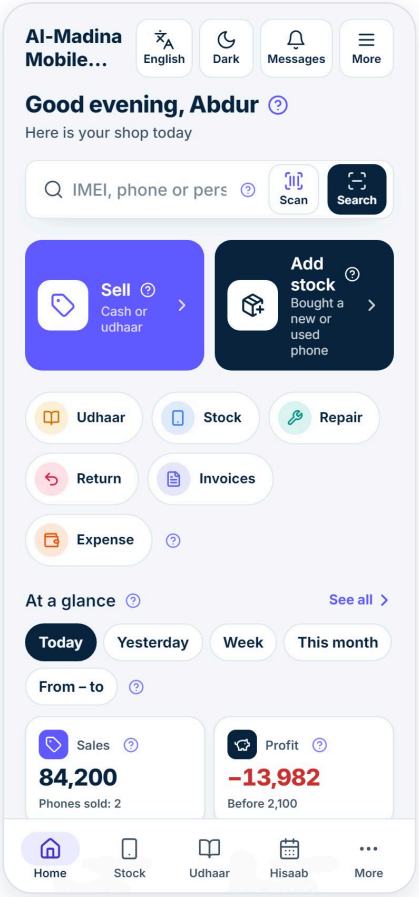

Logout

Tap your **Profile** button (your initials, top right) and then **Logout**. **Logout** is also at the bottom of **More**. Always log out on a phone that other people use.

4. The home screen, the More menu and the "?" help

The home screen

After logging in you see the home screen. Everything you do most often starts here.

Picture 2: The home screen

From top to bottom:

Part	What it does
Header	The shop's name, then **English** (language), **Messages**, **More** and your **Profile** button (your initials).
Greeting	"Good morning", "Good afternoon" or "Good evening" with your name, and *Here is your shop today*.
Search box	Type an IMEI, a phone model or a person's name and tap **Search**. **Scan** reads a barcode with the camera.

Part	What it does
Sell	Sell a phone, cash or udhaar (chapter 8).
Add stock	You bought a new or used phone (chapter 6).
Other jobs	**Udhaar**, **Stock**, **Repair**, **Return**, **Invoices** and **Expense**.
At a glance	Pick **Today**, **Yesterday**, **Week**, **This month** or **From – to**. Cards show **Sales** (and phones sold), **Profit**, **Cash & bank**, **I will get**, **I have to give**, **Phones in stock**, **Expenses** and a **Last 7 days** chart. Tap **See all** for the full hisaab.
Needs attention	Things waiting for you, for example "2 phones: ID card check pending" or "1 repair jobs open". Tap a line to go straight there.

At the bottom is a bar with **Home**, **Stock**, **Udhaar**, **Hisaab** and **More**. It is on every screen, so you can always get back.

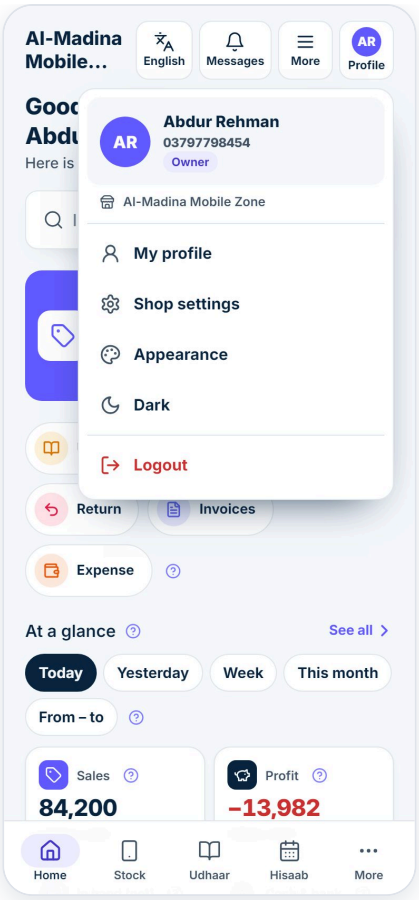

> **Note:** Profit and buying prices are shown only to the owner and the manager. A salesman sees the same home screen without them.

The Profile menu

Tap your **Profile** button at the top right (it shows your initials). A small menu opens with your name, mobile number, role (for example **Owner**) and the shop you are working in. Under it:

- **My profile**: opens **More**, with your language, quick PIN and fingerprint login.
- **Shop settings** (owner only).
- **Appearance**: how the app looks (chapter 5).
- **Dark** / **Light** (on a phone): switch the screen colour in one tap. On a laptop this button is in the header.
- **Logout**.

Tap outside the menu, or press Esc on a computer, to close it.

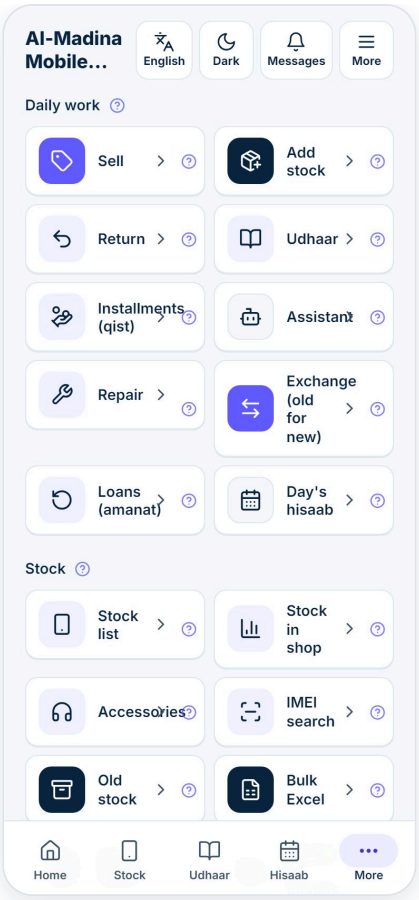

Picture 3: The Profile menu

Scanning from anywhere

If you have a USB or Bluetooth barcode scanner, plug it in. No setup is needed. Scan a phone's sticker on the home screen and its page opens. Scan an unknown code and the app offers to add it. The scanner works even when the phone's keyboard is in Urdu.

The More menu

Tap **More** (top right, or at the bottom) to see every part of the app, sorted into groups.

Picture 4: The More menu

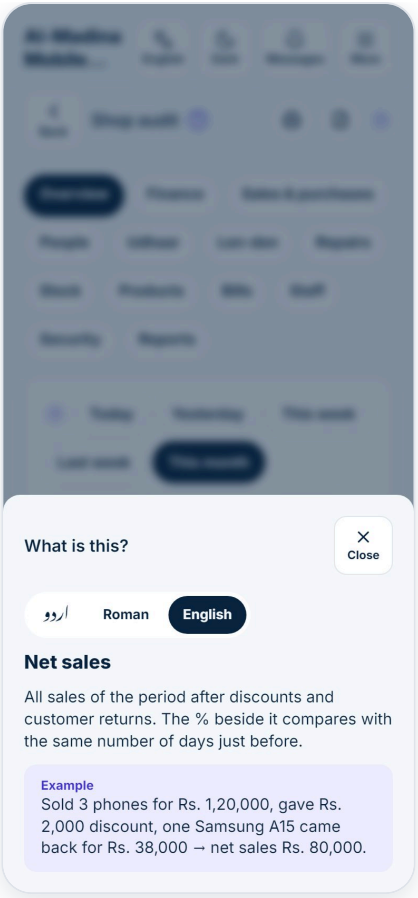

- **Daily work**: Sell, Add stock, Return, Udhaar, Installments (qist), Assistant, Repair, Exchange (old for new), Loans (amanat), Day's hisaab.
- **Stock**: Stock list, Stock in shop, Accessories, IMEI search, Old stock, Bulk Excel, Stock count, Brands & models.
- **Records**: the lists of sales, purchases, invoices, money received / paid and returns.
- **Money & reports**: Cash & bank, Expenses, Close the day, Reports and the Shop audit.
- **Shop & staff**: Shop settings, Staff, People & khata, Notifications, Software fees.
- At the bottom: Language, **Appearance**, **Set quick PIN**, fingerprint login and **Logout**.

You will only see what your role allows. A salesman, for example, does not see Reports.

The "?" help on every field and card

Shopkeepers told us that some words in software are hard to follow. So every screen title, every tab, every card and every field has a small **?** next to it.

1. Tap the **?** next to anything you do not understand.
2. A sheet opens from the bottom with the title **What is this?**
3. It shows the name of the thing, one or two plain sentences about what it is, and an **Example** box with a real shop case in rupees.
4. Tap **Close** to go back. Nothing on the screen changes.

Picture 5: The "?" help sheet with its own language switch

The help sheet has its **own** language switch at the top: **اردو**, **Roman** and **English**. It changes only the explanation, not the app. So a salesman can keep the app in English and read the help in Urdu, or the other way round. The app remembers his last pick.

Example: You are looking at the shop audit and do not know what **Net sales** means. Tap its **?**. It says: all sales of the period after discounts and customer returns. The example: *Sold 3 phones for Rs. 1,20,000, gave Rs. 2,000 discount, one Samsung A15 came back for Rs. 38,000, so net sales are Rs. 80,000.*

> **Tip:** When you train a new salesman, ask him to tap the **?** on every field the first time he adds stock. In ten minutes he will know the screen.

5. Language, theme and look

Language

The app shows **one language at a time**. Urdu mode is all Urdu, written right to left. English mode is all English. Numbers are always written 0 to 9, in every language.

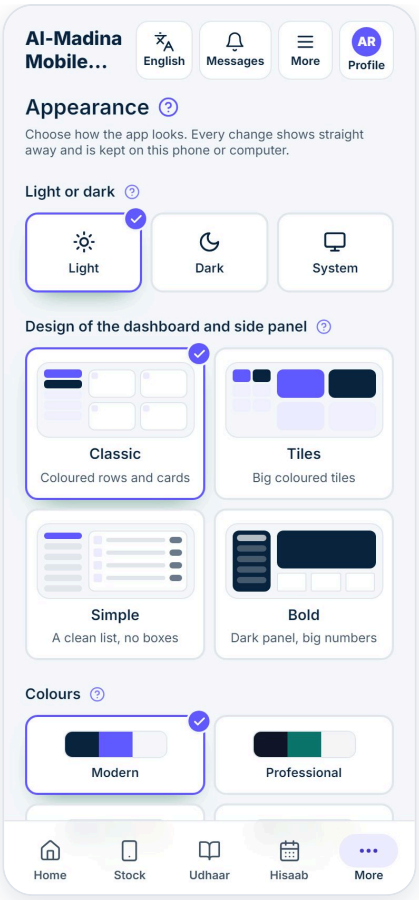

1. Tap the language button in the header (it shows the current language, for example **English**).
2. Pick **اردو**, **Roman Urdu** or **English**.

You can also change it in **More** → **Language**. Each person can choose his own language on his own phone.

WhatsApp messages follow the **shop's language**, which the owner sets in **Shop settings**. For printed and downloaded papers (receipts, invoices, declarations, job sheets, reports) there is a **Document language** switch right above the print and share buttons: **English** or **اردو**. English is chosen at the start; tap **اردو** for an Urdu paper. Your choice holds until you close the app.

Appearance (theme, design, colours, text size)

Open **Appearance** from the **Profile** menu, from **More**, or from the button on the dashboard. Every change shows straight away and is kept **on this phone or computer only**. Each salesman can set his own phone the way he likes; your data never changes.

Picture 6: The Appearance page

Part	What it does
Light or dark	**Light**, **Dark**, or **System** (follows the phone's own setting). The **Dark** / **Light** item in the Profile menu does the same in one tap.
Design of the dashboard and side panel	**Classic** (coloured rows and cards, as before), **Tiles** (big coloured tiles), **Simple** (a clean list, no boxes) or **Bold** (dark side panel and big numbers). On a laptop it also changes the side panel.
Colours	The colour set of the whole app: **Modern**, **Professional**, **Navy** or **Colorful**.
Main colour	The colour of buttons and highlights: **Default**, **Green**, **Blue**, **Purple**, **Red**, **Orange** or **Teal**.
Text size	**Normal**, **Large** or **Extra large**. Good for older eyes.
Corners	How round buttons and cards are: **Default**, **Round**, **Soft** or **Sharp**.
Numbers font	The font for amounts: **Default**, **Inter**, **Manrope** or **Phone's own**.

Part	What it does
Back to default	Undo all of the above on this phone.

> **Tip:** On the shop's counter PC choose **Large** text and the **Bold** design: the day's sales and profit are big enough to read from a step away.

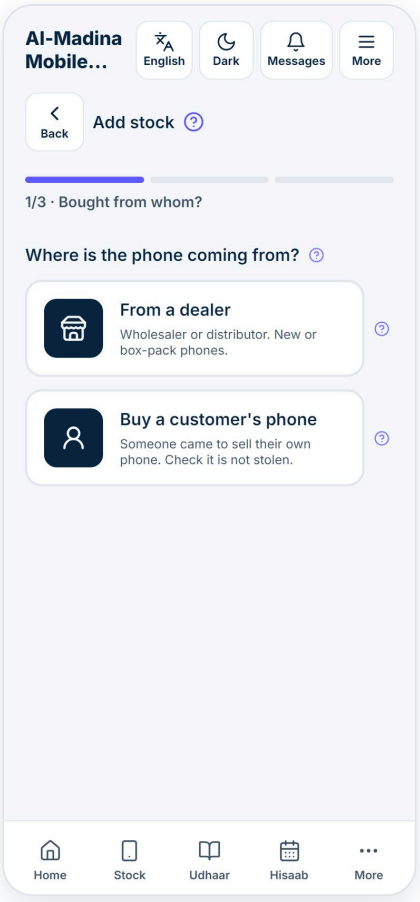

6. Add stock (buying)

Use **Add stock** every time a phone, tablet, watch or accessory comes into the shop. It has three steps, shown by the bar at the top: **1 Bought from whom? → 2 Which phone, how much? → 3 Done**.

Why it matters: every phone you add gets its own page and its own history from the first day. Later you can see who you bought it from, what you paid, who you sold it to and how much you earned on it.

Step 1: Where is the phone coming from?

On Home, tap **Add stock**. The first screen asks **Where is the phone coming from?** and shows two big cards.

Picture 7: Add stock, step 1: where is the phone coming from?

- **From a dealer**: a wholesaler or distributor. Usually new or box-pack phones.
- **Buy a customer's phone**: someone came to sell his own phone. The app will help you check that it is not stolen.

Buying from a dealer

Example: You buy a box-pack **Samsung Galaxy A55 256GB Blue** from **Rehman Traders** for **Rs. 92,000** cash. You will sell it for **Rs. 1,00,000**. The box and cable came with it; the dealer will send the

charger in three days.

1. On Home tap **Add stock**, then **From a dealer**.
2. In **Select dealer**, type a few letters (`Rehman`) and tap **Rehman Traders**. A new dealer? Tap the **+** button and fill in his name and mobile number.
3. Tap **Next**.
4. Tap **Add device**. The **Add device** form opens.
5. Under **What is it?** leave **Mobile** chosen.
6. In **IMEI**, type the 15 digits or tap **Scan** to read the barcode on the box. Under the box the app tells you **New IMEI, not seen before** or **This IMEI has been in your shop before**.
7. For a dual-SIM phone, fill **IMEI 2** the same way.
8. Tap the **Brand** (**Samsung**), then the **Model** (type `A55` and tap **Galaxy A55**).
9. Choose **Storage** (`256GB`) and **Colour** (`Blue`).

For an **Apple** iPhone the form also asks the **Region code** and the **SIM** type. The region code is the end of Settings → General → About → Model Number (MLPF3**LL/A** → tap **LL/A**). For SIM, tap **Physical + eSIM**, **Dual eSIM** (US iPhones from the 14 onwards have no SIM tray), **Dual physical SIM** or **Physical SIM only**. Not in the list? Tap **New** and type it; the app offers it next time. For a used or open-box iPhone it also asks **Battery cycle count** (iPhone 15 and newer: Settings → General → About; leave empty on older ones). These show on the stock list and the price sticker.

SIM lock (network) (any phone, iPhone or Android): tap **Unlocked** or **SIM locked**; for a locked one tap the network (AT&T, T-Mobile, Verizon ...) or type it. It shows on the phone's page, in the review before saving, and as a stock list column. It is only information — a SIM-locked phone can still be sold. Leave it empty if you did not check.

1. **Condition**: tap **Box pack**. The other choices are **Open box**, **Used** and **Patched** (patched asks for **Patch details**).
2. **PTA status**: tap **PTA approved**. For **Non-PTA** and **JV** the app also asks **SIM time (months)**; it is optional, leave it empty if you do not know.
3. **Cost price**: type `92000` , what you paid.
4. **Asking price (optional)**: type `100000` , what you want to sell it for. Not decided yet? Leave it empty and set it later from the phone's page (**Change price**).

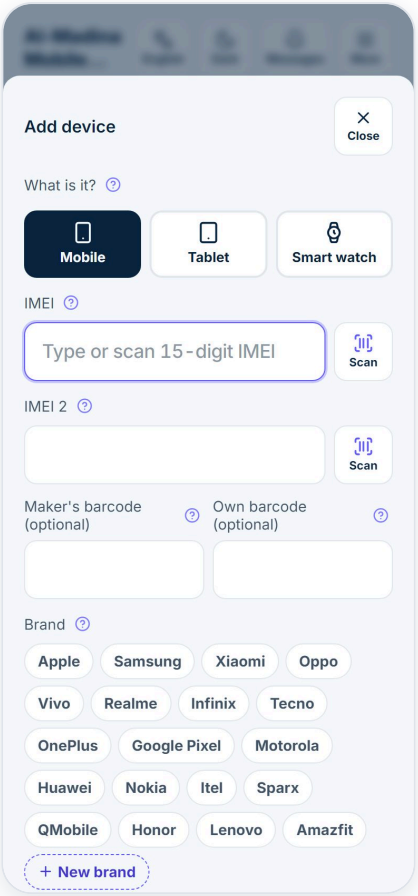

For an **Open box**, **Used** or **Patched** phone the form also asks **Battery health %** (iPhone: Settings → Battery → Battery Health). Leave it empty if the phone does not show it.

1. **Warranty (months)**: a dealer phone usually starts at 12.
2. **What came with the phone?** For Box, Charger, Cable, Earphones and AirPods choose **No**, **Got it** or **Later**. Here: Box **Got it**, Cable **Got it**, Charger **Later**, and pick the date in **When will they give it?**
3. Tap **Add**. The phone appears in the list. Tap **Add device** again for the next phone.

Forgot something, like the colour? Tap **Edit** on that phone in the list, change it and tap **Save**. **Back** (or the phone's own back button) takes you to the first step with everything still filled in; **Next** brings you

back to your phones.

The same works in **Sell**, **Exchange** and **Return**: **Back**, the phone's back button or a tap on the bar of an earlier step goes one step back and keeps everything. A form that pops up from below (like **Add device**) no longer closes when you tap beside it by mistake once something is filled in: tap **Close** to leave it.

Picture 8: The Add device form

When all the phones are in the list, finish the payment part on the same screen:

1. **How did you pay?** Tap **Cash** (or another way, see below).
2. **When was it bought?** Leave **Just now**, or tap **Earlier** and pick the date and time if you are entering yesterday's purchase.
3. Tap **Discount, bill no.** if you need the extra boxes (see "Reference / slip no." below).
4. Check the **Total**: Rs. 92,000.
5. Tap **Put in stock**.
6. **Check before saving** opens: the seller, every phone with its IMEI, memory, colour, condition, PTA, battery, cost and asking price, the total and how it was paid. If something is wrong, tap **Edit** on that phone. When all is right, tick **I have checked: every detail is right** and tap **Put in stock**.

You see **Purchase saved**, the amount and the purchase number, for example `PUR-000001`. From here you can also tap **Print stickers for these phones** to print price stickers with a barcode.

> **Note:** The **Asking price** cannot be lower than the **Cost price**. If you type less, the app says *"Selling price cannot be less than the buying price"* and **Add** stays grey.

> **Tip:** The same IMEI cannot be in your stock twice. If the app refuses an IMEI, check the stock list; the phone may already be there.

Rate suggestion while buying

Once you pick the model, a green box under **Asking price** shows your own history for that model: when you last sold one and for how much, how many you sold in six months and at what range, and how many are in stock now. Tap **Use ...** to take the suggested price. It reads only your own shop's sales.

How was it paid?

Under **How did you pay?** tap one big button.

Button	When to use it	What it asks
Cash	Money from the galla	Nothing more
Online	Bank app, IBFT, Raast, Easypaisa, JazzCash, SadaPay	Which bank or wallet (or **Other bank / wallet**), and a transaction ID if you want
Cheque	You gave a cheque	The bank, the cheque number and the cheque date
Udhaar	You will pay later	What you paid now, if anything

Each way keeps its own account, so the day's hisaab shows how much went out in cash and how much from the bank. If you made accounts in **More** → **Cash & bank** (for example "Meezan Bank" or "Shop Easypaisa"), you can pick the exact account.

Paying on udhaar

Example: You buy 3 phones from **Rehman Traders** for **Rs. 2,40,000**. You pay **Rs. 1,50,000** now and the rest next week.

1. Add the phones as above.
2. Under **How did you pay?** tap **Udhaar**.
3. In **Paid now (if any)** type `150000`.
4. **Still to give** shows **90,000**. This goes into Rehman Traders' khata under **I have to give**.
5. If he agreed a date, fill **We pay the supplier by (optional)**. After that date the audit shows this udhaar as overdue.
6. Tap **Put in stock**.

Later, when you pay him, use **Udhaar** → **Money paid** and pick Rehman Traders.

Reference / slip no. and the dealer's bill number

Tap **Discount, bill no.** on a dealer purchase to see these optional boxes:

- **Discount**: money the dealer took off the whole bill.
- **Reference / slip no.**: any number or word that helps you find this purchase later, such as the dealer's slip or lot number, for example `Slip 4471` or `Hall Road lot 3`. It is only kept for searching.
- **Supplier bill no.**: the number printed on the dealer's own bill, for example `RT-2026-118`, so you can match it with his paper if there is ever a question.
- **Freight / loading (Rs.)** and **Freight note**: transport or loading charges. They are spread over the lines and added to the item cost, so your profit stays true.

A brand, model, storage or colour is missing

If you cannot find it in the **Add device** form:

1. Tap **+ New brand**, **+ New model**, **+ New size** or **+ New colour**.
2. Type the name, for example brand `Dcode`, model `Bold 3`.
3. Tap **Save**. It is chosen at once and will be in the list next time.

You can rename or delete your own entries later in **More** → **Brands & models**. Built-in ones, and ones already used on a phone, cannot be deleted.

Buying a customer's phone

Example: Ali Raza walks in to sell his used **Infinix Hot 40 128GB**. You agree **Rs. 28,000**. You pay **Rs. 20,000** now and **Rs. 8,000** tomorrow. You will sell it for **Rs. 34,000**.

1. **Add stock** → **Buy a customer's phone**.
2. Under **Who is selling the phone?** search for the person by name, phone or CNIC. If he is new, tap **+** (**New person**).
3. Fill **Name** (`Ali Raza`) and **Mobile number** (+92 is fixed; type `3005550606`).
4. Fill **CNIC**: type the 13 digits `3740512345673` and it shows as `37405-1234567-3`. Or tap **Scan CNIC (photo of the front)** to have the app read it (see chapter 7).
5. Tap **Save**, then **Next**.
6. Tap **Add device** and fill in the IMEI, **Infinix**, **Hot 40**, `128GB`, condition **Used**, **Cost price** `28000`, **Asking price** `34000`. Tap **Add**.
7. Under **How did you pay?** tap **Udhaar** and type `20000` in **Paid now (if any)**. **Still to give** shows **8,000**, which goes into Ali Raza's khata. Under **How was the amount paid now paid?** choose **Cash**, **Online** (bank or wallet, and the TID) or **Cheque** (bank and cheque number).
8. Under **ID card check** choose **Check now / later** (the normal choice) or **Skip, I know this person**.
9. Tap **Put in stock**.

The done screen says **Check the phone is not stolen**, with **Check ID card now**, **Skip, I know this person** and **Print declaration**. Go to chapter 7 for the check.

> **Important:** If you skip, the phone shows **Skipped, known person** and your name is written in its history. The owner can see every skip in the audit. Skip only for people you really know.

Tablets and smart watches

Tablets and smart watches are tracked one by one, just like phones, each with its own page and history.

1. In **Add device**, under **What is it?**, tap **Tablet** or **Smart watch** instead of **Mobile**.
2. Only brands that make that kind are shown, for example Apple, Samsung and Lenovo for tablets, or Apple, Samsung, Huawei and Amazfit for watches.
3. Fill in the questions for that kind (see the table below) and tap **Add**.

	Mobile	Tablet	Smart watch
SIM	Always	**Wi-Fi only** or **Wi-Fi + SIM**	**No SIM (GPS)** or **With SIM (Cellular)**
IMEI	IMEI and IMEI 2	Only with a SIM	Only with a SIM
Serial number	Not needed	Needed without a SIM	Needed without a SIM
PTA	PTA approved, Non-PTA, JV	Only with a SIM, no JV	Only with a SIM, no JV
Size	Storage	Storage	**Case size** (38 to 49 mm)
Battery health %	For open box, used or patched	For open box or used	For open box or used
What came with it	Box, charger, cable, earphones, AirPods	Box, charger, cable, pen / stylus, keyboard cover	Box, charger, extra strap

Without a SIM there is no IMEI, so the **Serial number** (on the box, or in Settings → About on the device) is used for searching and shown like an IMEI.

The lock check for used devices

A used tablet or watch can be locked to the old owner's account. If it is, the next buyer cannot use it. So when you buy a used unit, the **Lock check (used device)** box appears in the form:

- **iCloud / activation lock** (Apple's Find My).
- **Google / FRP lock** (Android asks for the last Google account after a reset).
- **Samsung / account lock** (a maker's own account).
- **Paired-device lock** (a watch still joined to the old owner's phone).

For each one tap **Cleared**, **Still on** or **N/A**, then tick **Lock checked and removed**.

- Tablets and smart watches always need this check. Used mobiles need it when the owner has switched on **Lock check also required for used mobiles** in the device settings.
- A unit with any lock **Still on** cannot be bought: the app says *"A lock is still on — do not buy until it is removed"*. Ask the seller to remove it in front of you, then mark it **Cleared**.

Example: A customer brings a used **iPad 9th gen Wi-Fi**. You open Settings on it and see Find My is still on. Mark **iCloud / activation lock** as **Still on**. The app will not let you buy it. The customer signs out of his Apple ID; now you mark **Cleared**, tick the box and continue.

Accessories in a purchase

Chargers, cables, covers, glass, earphones, power banks and ordinary watches (Casio, Naviforce) are kept **by count**. There is no IMEI, only how many you have.

1. In step 2 of Add stock, tap **Add accessory / watch**.
2. Search the item by **Name or code** and tap it. Not in the list? Tap **New item (not in the list)**, write the **Name**, choose **What is it?** (Charger, Cable, Watch and so on, or **New kind** for your own, for example *Ring light*), type the **Selling price (each)** and tap **Save and add**.
3. Choose how the dealer sold it: **Piece**, **Dozen**, **Box** or **Carton**.
4. Type the **Qty** and the **Unit cost** (the price of one piece, or of one dozen or box if you chose that).
5. Finish the purchase as usual and tap **Put in stock**.

The stock is always kept in pieces. **Example:** you buy **5 dozen** Type-C cables at **Rs. 1,200 a dozen**. The stock shows **60 pieces** at **Rs. 100 each**, and the line comes to Rs. 6,000.

On a dealer purchase you can also tap **+ Charger, cover or other item** to type a free line (a name, a quantity and a cost) that is not a stock item.

> **Tip:** Each accessory can carry more details on its own page in **Accessories**: a dealer price, a minimum price, a promo price and its own **GST % (optional)**. The minimum price and GST % are used when you sell it (chapter 8).

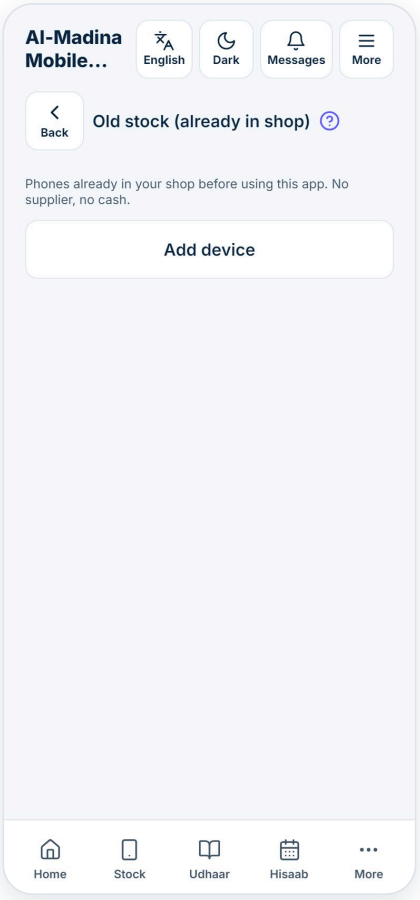

Scanning while buying

- Tap **Scan** next to **IMEI** to read the box with the camera. The camera looks for the IMEI first, even when the box has several barcodes.
- With a USB or Bluetooth scanner, scan the box: the first scan fills **IMEI**, the next fills **IMEI 2**, then **Maker's barcode (optional)**.
- **Own barcode (optional)** is for a sticker code you already use. Leave it empty and the app gives the phone its own barcode when you save. That barcode never changes.

Old stock already in the shop

When you start using the app, the phones already on your shelves have no purchase bill and no money to pay. Enter them as old stock.

1. **More** → **Old stock**.
2. Tap **Add device** and fill the form as above, with the price you paid as **Cost price**.
3. Tap **Add**. Repeat for every phone.
4. Tap **Save**. You see **Purchase saved**.

Picture 9: Old stock (already in shop)

No money leaves the galla. Old stock only makes your stock and its worth complete. **Example:** three old phones at Rs. 30,000, Rs. 45,000 and Rs. 60,000 add Rs. 1,35,000 to your stock worth.

> **Tip:** Many phones to enter? Use **More** → **Bulk Excel** to fill a sheet on the computer and bring them all in at once.

If an old-stock phone was entered by mistake, open it from the stock list and tap **Remove old-stock entry**, writing why.

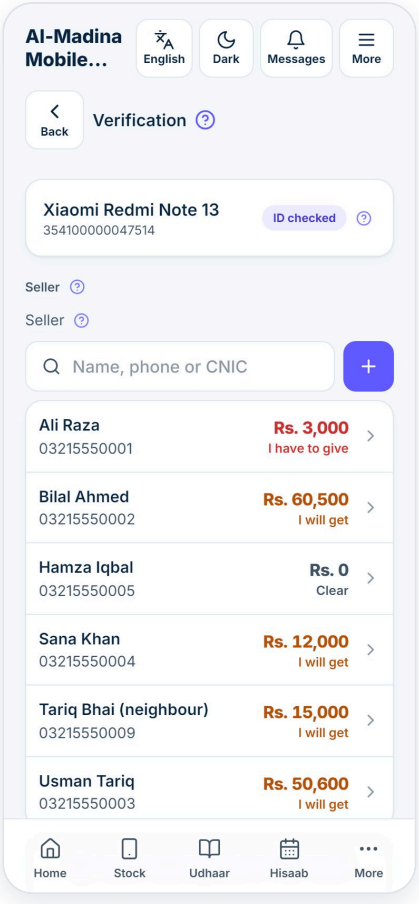

7. Checking a used phone (ID check and signed declaration)

Do this for every used phone, tablet or watch you buy from a person. It protects you from buying a stolen phone, and if the police ever ask, you have the seller's identity, photos and signature in one place.

Opening the check

You can open the **Verification** screen in three ways:

- Right after buying: **Check ID card now** on the done screen.
- From the phone's page: **ID card check**.
- From Home: **Needs attention → phones: ID card check pending**.

Picture 10: The Verification screen

At the top you see the phone, its IMEI and its status chip: **ID check pending**, **ID checked** or **Stolen? Do not sell**.

Step by step

Example: You bought a used **Xiaomi Redmi Note 13** from **Usman Tariq** for **Rs. 55,000**.

1. **Seller**: already filled with the person you bought from. You can change it by searching name, phone or CNIC.
2. **CNIC number**: check the 13 digits.
3. Tap each photo box and take a photo with the camera: **CNIC front**, **CNIC back**, **Seller photo** and **Phone photo**. **Thumb (optional)**: the seller presses an inked thumb (stamp pad) on paper or in the **Thumb impression** box of the printed declaration; take a photo of it. It is kept with the check and printed in the declaration's thumb box. The check is complete without it. This is a record, not a NADRA biometric match (that needs a licensed fingerprint scanner).
4. **eGadget (Punjab Police)**: tap **Open eGadget portal**, check the IMEI there, come back and choose **Clear**, **Flagged** or **Not checked**. Type the **Reference no.** if the portal gives one.
5. **PTA checked (SMS 8484)**: tap **SMS 8484** to send the IMEI to PTA, then tick the box and pick the **PTA result**.
6. **Seller signed declaration**: the seller signs on the screen (see below).
7. **Physical condition notes** (optional), for example *small scratch on back, screen original*.
8. Tap **Save**.

The **Result** card at the bottom shows the status and a **Still missing** line that lists exactly what is not done yet, so you never have to guess.

Scan the CNIC instead of typing

1. Tap **Scan CNIC (photo of the front)**. It is also on the **New person** form.
2. Take a clear photo of the front of the card in good light.
3. After a few seconds the **name** and **CNIC number** are filled in, and the photo is kept as the CNIC front. The father's name, date of birth and card expiry go into the notes.
4. Check every filled field before saving and correct any digit that was misread.

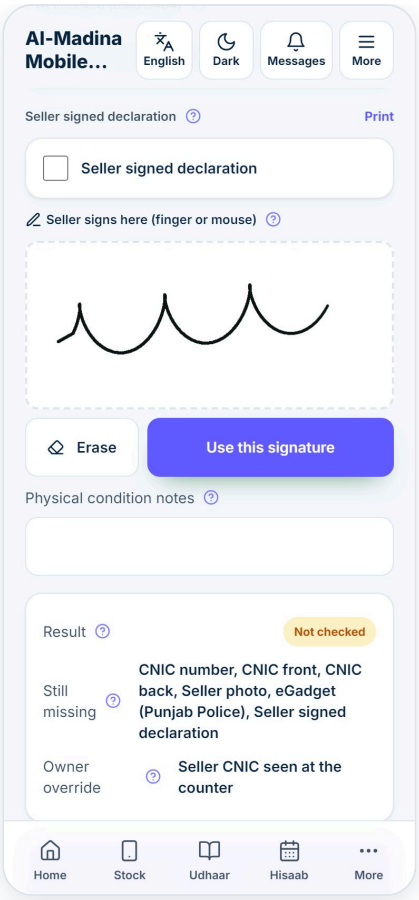

If the card has expired, you see a warning. The Urdu address is not read; type it yourself if you need it.

> **Note:** The photo is read on your own phone. It is not sent anywhere just for reading.

The seller signs on the screen

The seller confirms, in his own hand, that the phone is his and not stolen.

1. Scroll to **Seller signed declaration**.
2. Hand the phone to the seller. Under **Seller signs here (finger or mouse)** he signs inside the dotted box with his finger.
3. Not happy with it? Tap **Erase** and he signs again.
4. Tap **Use this signature**. The declaration is marked signed (**Signed by the seller**).
5. Tap **Save** at the bottom of the screen.

Picture 11: The seller signs on the screen

The signature is saved with the ID check, next to his CNIC photo and the phone's IMEI. To change it later, tap **Sign again**.

The printed declaration

Tap **Print** next to **Seller signed declaration** (or **Print the declaration** after saving). The declaration prints in the language you pick under **Document language** (English or Urdu). It shows the shop, the seller's name and CNIC, the phone and its IMEI, the date, and **his signature above the line**. You can also download it as a PDF or share it on WhatsApp.

> **Tip:** Some shops still like a paper copy signed with a pen as well. Print it, let him sign, and keep it in the file. The on-screen signature stays saved in the app either way.

After saving

A result screen tells you where you stand:

- **ID check complete. This phone can be sold.** with a **Sell this phone now** button.
- **Saved, but the check is not complete yet. Still missing: …** The phone stays **ID check pending** until the rest is done.
- **Flagged as possibly stolen. Do not sell it; only the owner can override.** The phone shows **Stolen? Do not sell**.

From there you can go **Back to the phone**, **Print the declaration** or **Change something**.

Owner override

Sometimes papers are missing for a good reason, for example a phone bought from a close relative. The owner or manager can fill **Owner override** with a **Reason for override** (at least 5 letters), for example *Regular customer for 3 years, CNIC seen*. The check then counts as complete. The reason and the name of the person who did it stay in the phone's history.

A phone with a pending check

A phone whose check is not done cannot be sold by mistake. At the sale the app says *"This phone's ID card check is pending"* and **Complete sale** stays grey until you choose:

- **Check now**: opens the Verification screen.
- **Skip and sell (I know this person)**: anyone allowed to sell can do this. Your name is saved in the phone's history and the owner sees it in the audit.

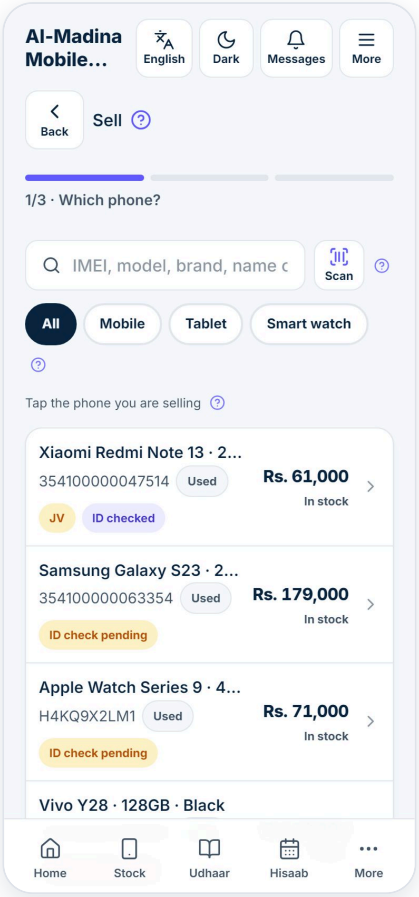

A phone marked **Stolen? Do not sell** can be sold only by the **owner**, with a written reason. A tablet or watch with a lock **Still on** cannot be sold at all until the lock is cleared.

8. Selling

Selling has three steps, shown at the top: **1 Which phone?** → **2 How much?** → **3 Done**. The app works out the totals; you only type the price you agreed.

Step 1: Pick the phone

1. On Home tap **Sell**.
2. Find the phone: type part of the IMEI, the model, the brand or a name in the search box, or tap **Scan** to read the box or the shop's sticker.
3. Use the chips **All**, **Mobile**, **Tablet** and **Smart watch** to narrow the list.
4. Under **Tap the phone you are selling**, tap the phone.

Picture 12: Sell, step 1: pick the phone

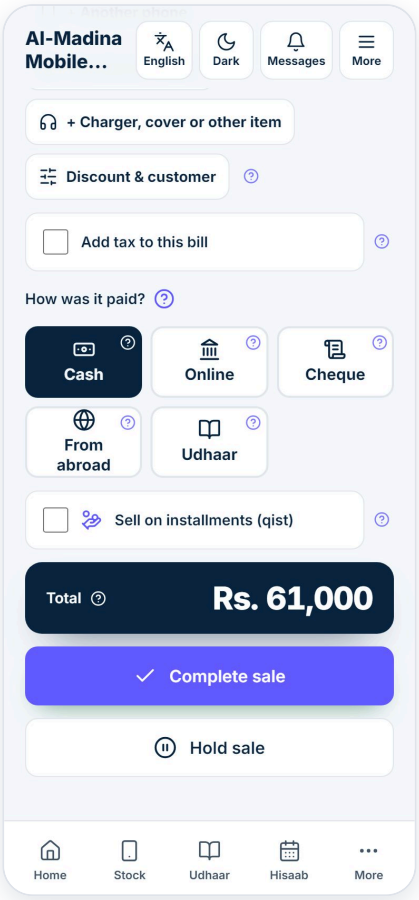

Each row shows the model, the IMEI (or the serial for a watch), the condition, the PTA chip (for example **JV**), the check status (**ID checked** or **ID check pending**), the asking price and **In stock**.

> **Tip:** With a USB scanner you do not even need to tap the search box. On the sale screen, scan the phone's sticker and it goes on the bill with its asking price. Scan an accessory twice and its quantity becomes 2.

A cash sale

Example: You sell a **Vivo Y28 128GB** for **Rs. 36,000** cash, with a 1-month warranty. The charger goes with it now; earphones are promised next week.

1. Pick the phone. Step 2 opens.
2. **Sold for (Rs)** is filled with the asking price. Change it to `36000` if you agreed another price.
3. **Warranty**: tap **None**, **7 days**, **1 month**, **3 months**, **6 months** or **1 year**. Here: **1 month**.
4. **What goes with the phone?** For each item tap **No**, **Given** or **Later**. Here: Charger **Given**, Earphones **Later**, with a date in **When will we give it?** Items that came with the phone start as **Given**.
5. Need more on the bill? Tap **+ Another phone**, **Accessory / watch** (a counted item from stock) or **+ Charger, cover or other item** (a free line, no stock change). **Discount & customer** opens a discount box and an optional customer.
6. **How was it paid?** Tap **Cash**.
7. Check the **Total** and tap **Complete sale**.
8. The **Check before you sell** screen shows each phone's sold price against its asking price (and, for the owner and manager, its cost and profit). Tap **Confirm and make the bill**.

Picture 13: Step 2: what goes with the phone, more lines, and tax

The done screen shows **Sale complete**, the amount and the bill number, for example `INV-000018`.

Who is buying? Every sale asks it. Search the customer by name, phone or CNIC (or tap **+** for a new person). Only when the buyer does not want to give a name, tick **Walk-in customer (no name)**: no khata is kept and the bill prints "Walk-in customer". Until one of the two is done, **Complete sale** stays off, so a walk-in is never chosen by mistake.

Walk-in by mistake, or the wrong customer? Owner or manager: open the bill (**More** → **Sales**, or **Change customer** on the sold phone's page), tap **Put on a customer** (or **Change customer**), choose the right person, write the reason and tap **Save**. A walk-in bill shows in their khata as bought and paid (nothing more owed); a bill on the wrong person moves with what is left on it. Cash does not move; the phone's history keeps both names. Not possible once money was received on that bill later, or something was returned, exchanged or put on installments on it.

> **Note:** A walk-in sale must be paid in full. For part payment, choose the customer (or tap **Udhaar**).

An udhaar sale

Example: Imran Ali takes a **Redmi Note 13** for **Rs. 58,000**. He pays **Rs. 20,000** now and promises the rest by the 30th.

1. Pick the phone and check the price.
2. Under **How was it paid?** tap **Udhaar**.
3. **Who is taking it on udhaar?** Search `Imran` and tap **Imran Ali**, or tap **+** for a new person.
4. **Paid now (if any)**: type `20000`. **Remaining udhaar** shows **38,000**. Under **How was the amount paid now paid?** choose **Cash**, **Online** (bank or wallet, and the TID) or **Cheque**. The money goes into that account and the bill shows it.
5. **Promised to pay by (optional)**: pick the 30th. From the 31st the audit shows this udhaar as overdue.
6. Tap **Complete sale**, then **Confirm and make the bill**.

Imran Ali now appears in **Udhaar** → **I will get** with Rs. 38,000. When he pays, use **Udhaar** → **Money received**.

> **Tip:** For a customer who pays month by month, switch on **Sell on installments (qist)** on the same screen. The app makes a plan with an advance, monthly amounts, due dates and a guarantor (zamin). **Example:** phone Rs. 1,20,000, advance Rs. 30,000, 6 months, so Rs. 15,000 a month.

Payment methods

Under **How was it paid?** tap one big button:

Button	When	What it asks
Cash	Money in hand	Nothing more

Button	When	What it asks
Online	Bank app, IBFT, Raast, Easypaisa, JazzCash, SadaPay	Which bank or wallet (or **Other bank / wallet**), and the transaction ID if you want
Cheque	The customer gives a cheque	The bank, cheque number and cheque date
From abroad	The buyer's family sends money from another country	The currency, the amount, the rate, the sender's name, and optionally Western Union / MoneyGram and the MTCN
Udhaar	Pay later	The customer, and what he pays now

Example (from abroad): Usman's brother in Riyadh sends **500 SAR** through Western Union for a phone of **Rs. 37,100**. Tap **From abroad**, choose **SAR**, type `500` and the rate `74.20`. The app shows **Rs. 37,100**. Type the sender's name, tap **Western Union** and complete the sale. If the money is less than the bill, the rest goes on the customer's udhaar.

The receipt shows how it was paid, for example *Online · Meezan Bank · Ref TID778812*, and the day's hisaab shows how much came in each way.

Asking price and minimum price

Every phone carries an **asking price**, set when you bought it. At the sale the asking is filled in as **Sold for**. It is a target; you type the price you actually agreed.

- If you sell below the asking, the **Check before you sell** screen shows a red line, for example *Rs. 2,000 under the asking price*.
- If the market moved, tick **Update asking price**, type the **New asking price** and a **Reason**, for example *New model launched, rate dropped by Rs. 4,000*. The change is written in the phone's history with your name.
- An accessory can have a **minimum price**. If you go below it, the line says **Below the minimum price — needs the manager**.

Who may go below the asking is the owner's choice, in **Shop settings** → **Price rules**. For each of **Selling under the asking price** and **Changing the asking price** he picks **Anyone**, **Owner / manager** or **With owner PIN**. The owner and manager always may.

Example: Asking is Rs. 65,000. The salesman agrees Rs. 62,000. The shop's rule is **With owner PIN**. On the check screen an **Owner PIN** box appears; the owner types his PIN and taps **Confirm with PIN**. The phone's history shows Rs. 3,000 under asking, the salesman's name and the owner's approval.

> **Note:** Five wrong PINs lock the PIN box for ten minutes.

Price below the buying price

If **Sold for** is less than what the shop paid, a red box says the price is below the buying price and this is a loss.

- **Owner or manager**: tap **I know - sell at a loss** to allow it.
- **Salesman**: the sale is refused. He must raise the price or call the owner.

Example: Bought for Rs. 50,000, typed Rs. 47,000. That is a loss of Rs. 3,000; only the owner or manager can confirm it.

Rate suggestion

Under **Sold for**, a green box shows your own rate for this phone, for example *Last sold Rs. 57,500 on 12-10-2026*, how many days it took to sell, how many you sold in six months and the range, and how many are in stock now. Tap **Use ...** to take the suggested price, which is the middle of your recent sales rounded to the hundred. The owner and manager also see *Usually bought at Rs. ....*

Tax and item GST

Tax is **off** on every sale unless you add it.

1. Tick **Add tax to this bill**.
2. A **Tax %** box appears, starting at the shop's rate (usually 18).
3. The tax is added on top of the bill after discount, and the total shows that it **includes tax**.

Item GST. An accessory can have its own **GST % (optional)**, set on its page in **Accessories**. On a taxed bill that item is taxed at its own rate; phones and items without a rate take the bill's rate. The receipt then says **Tax (by item)**. A bill without tax stays without tax.

Example: A bill taxed at 18% has a phone of Rs. 10,000 and two cables of Rs. 500 each with GST 5%. Tax on the phone is Rs. 1,800 and on the cables Rs. 50. The bill's tax is Rs. 1,850 and the receipt shows **Tax (by item)**. The screen and the receipt always match to the paisa.

Hold a sale

A customer goes to the ATM to fetch money? Serve the next one first.

1. Tap **Hold sale** under **Complete sale**.
2. Write a **Name to find it (optional)**, for example `Ali ATM`, and tap **Hold**.
3. The screen is empty for the next customer. Nothing is sold yet and the phone stays in stock.
4. When Ali comes back, tap **Held sales** at the top of the sale screen, then **Resume**.

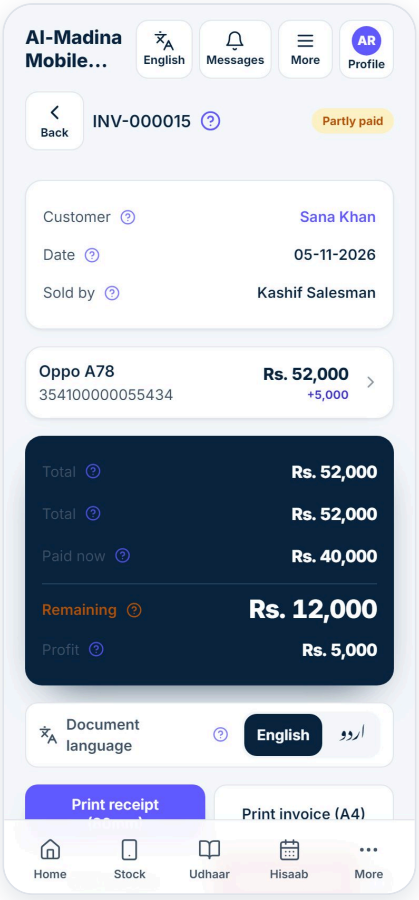

The bill comes back exactly as it was: prices, tax and payment. A held bill can be resumed from any phone of the shop. If one of its phones was sold meanwhile, it is taken off the bill and the screen tells you.

Receipt: print, PDF and WhatsApp

After **Sale complete** you can tap:

- **Print receipt (80mm)** for a thermal printer, or **Print invoice (A4)** for a normal printer.
- **Download PDF** to save the bill as a file.
- **Share PDF** to send it on WhatsApp, Gmail or any app on the phone.
- **Another sale** to start again, or **View sale** to open the bill.

The same buttons are on every sale's page, which you can open later from **Invoices**. The page shows the customer, the date, who sold it, every line, the total, what was paid, what is remaining and, for the owner and manager, the profit.

Picture 14: A sale's page with the Document language switch

Right above the print buttons there is **Document language** with **English** and **اردو**. English is chosen at the start; tap **اردو** to print or share this bill in Urdu.

> **Important:** A finished bill's amounts cannot be edited by anyone. If something was wrong, take the phone back with **Return** and make a new bill. Both stay on record, so the hisaab is always honest.

Tax bills, cash given and change

Every bill now shows, below the total, the **amount in words** (for example "Rupees Forty-One Thousand Seven Hundred Seventy Only"), the **cashier** who made it and the **time**.

Cash given and change. When the customer pays cash, type what they handed over in **Cash given by the customer**. The screen shows the change to give back, and the printed bill shows **Cash given** and **Change**. Leave it empty if you do not need it.

Tax bills. When you tick **Add tax to this bill**, the printed bill shows **Total excl. tax**, one line for each tax rate (for example "Tax 18% on 1,500") and **Total tax**, like an FBR tax invoice.

Phones and sales tax. Mobile phones are in the Ninth Schedule: the importer pays their sales tax, and the shop adds none. Turn on **More → Settings → Phones: sales tax paid at import** and a taxed bill adds tax only to chargers, covers and other items. The phone line says "Mobile phones — sales tax paid at import (Ninth Schedule)".

Example: phone Rs. 40,000 + charger Rs. 1,500 at 18% → tax Rs. 270, total Rs. 41,770. The customer gives Rs. 42,000 → change Rs. 230.

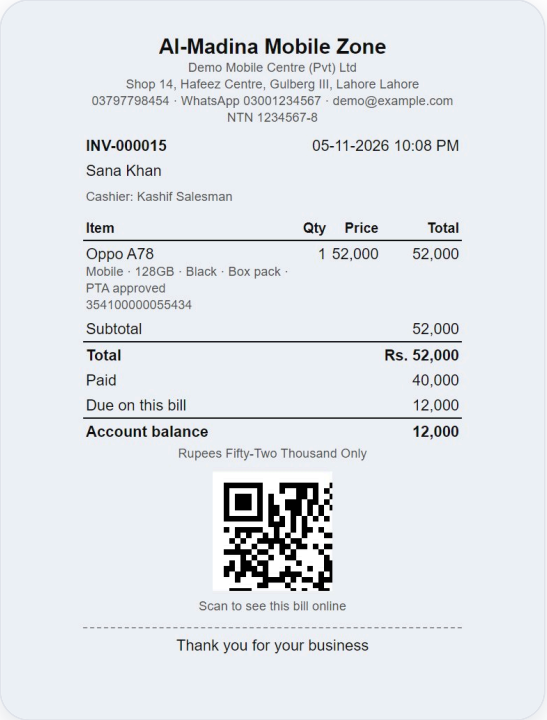

Extra cash against old udhaar. Sometimes a customer who already owes the shop hands over more than this bill. When a customer is chosen and owes from before, a tick appears under the change: **Keep ... against their old udhaar (owes ...)**. Tick it and the extra is not given back as change; it is taken against their old udhaar. Their khata goes down, their oldest bills are marked paid, and the printed bill shows it.

Example: Bill Rs. 2,000. Imran gives Rs. 5,000 and owes Rs. 3,000 from last month. Tick the box: change Rs. 0, old udhaar cleared.

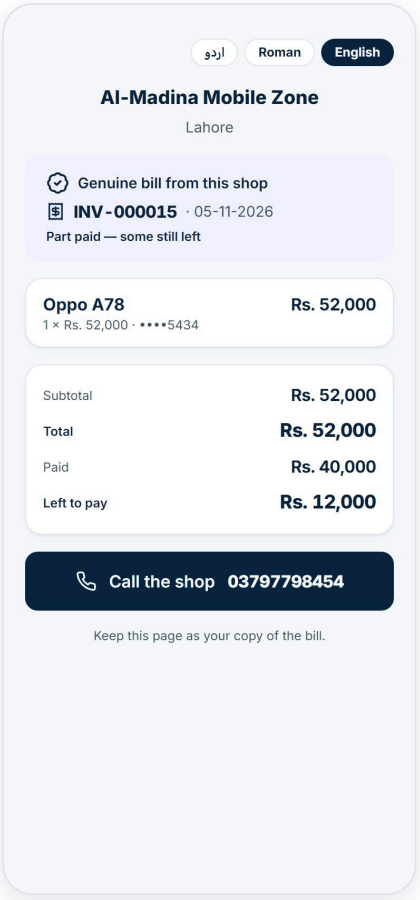

> **Note:** A shop registered for sales tax can send every bill to FBR and print the FBR number and its QR code. See **FBR Digital Invoicing** in chapter 23.

The QR code on every bill

Every printed sale bill (80 mm and A4) has a QR code at the bottom with the words **Scan to see this bill online**. The customer scans it with the phone's camera and sees the bill without logging in: the shop's name, the bill number and date, each item (the IMEI shows only its last 4 digits), the total, what was paid and what is **Left to pay**, with a **Call the shop** button. It says **Genuine bill from this shop**, so a customer, a buyer of the phone later, or a warranty claim can check the bill is real.

Picture 15: A printed bill with its QR

Picture 16: The bill opened from the QR

- The page never shows the customer's phone number, CNIC, the buying price or the profit.
- If the bill is later returned or cancelled, the page says so.

- The link cannot be guessed or changed: a changed link shows "This bill could not be found".
- To print bills without the QR, open **More → Shop settings → Business profile → Printed bill** and untick **QR code to see the bill online**.

> **Note:** On the PC version with no internet address, the QR holds only the bill number.

9. Returns

Sometimes a customer brings a phone back: it has a fault, it is not what he wanted, or he simply changed his mind. The **Return** screen takes the phone back into your stock, works out how much you give back and how much the shop keeps, and writes everything on the record. Nothing is deleted: the original bill stays, and the return is added next to it with its own number (for example **RET-000001**).

The return works in three short steps: **What came back?**, **How much to give back?** and **Done**.

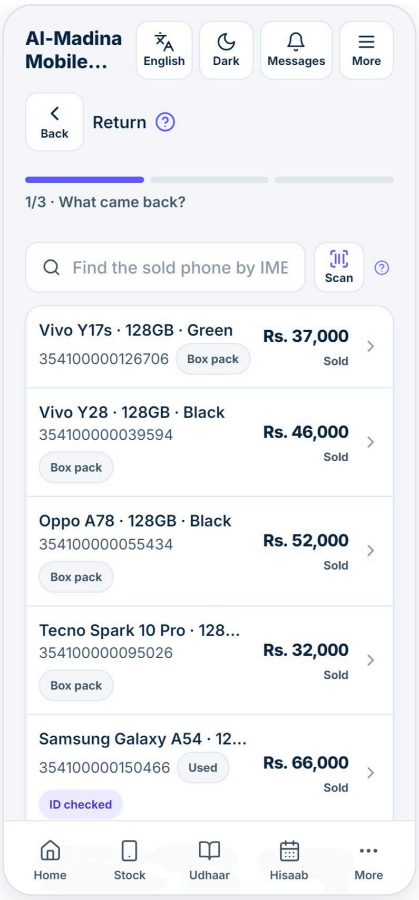

Before you start

- You need the sold phone (or the bill it was sold on). You can find it by IMEI, by the buyer's name or by the buyer's phone number.
- If the phone was sold to a walk-in customer with no name, the app will ask **Who brought it back?** so the money has a person against it.
- The shop decides how much to give back. The app never forces a full refund.

Take a phone back, step by step

Example: Usman Tariq bought a **Vivo Y17s** for **Rs. 37,000** cash. Two days later he brings it back because of a speaker fault. You agree to give him **Rs. 35,000** and keep **Rs. 2,000** for the trouble.

1. On Home tap **Return**. You can also open the sold phone's own page and tap **Return** there.
2. Step **1/3 · What came back?** shows a search box **Find the sold phone by IMEI, buyer's name or phone** and a list of recently sold phones. Type part of the IMEI (for example **6706**) or **Usman**, or tap **Scan** and scan the phone's barcode or IMEI.
3. Tap the **Vivo Y17s** in the list. You can also pick a whole bill from **Or pick from recent sales**.
4. Step 2 shows every line on that bill with a tick box. The phone you tapped is already ticked. If the bill also had a charger or cover that is coming back, tick it too. Lines that were already returned are greyed out and marked **Returned**.
5. If the sale had no customer name, choose the person under **Who brought it back?** (or add a new person).
6. **Customer had paid** shows what the customer actually paid for the ticked lines: here **37,000**.
7. Under **Give back from** tap where the money comes from: **Cash** (your galla) or one of your bank / wallet accounts. For a known customer there is also **Keep in khata**: the money is not paid out, it stays in his khata (account) and he can use it against his next purchase.
8. In **Give back to customer (Rs)** the full amount is filled in. Change it to **35000**. The box **Shop cuts** shows **2,000** by itself.
9. In **Why? (optional)** type the reason, for example **speaker fault**.
10. Tap **Take it back**.

Picture 17: The Return screen: find the sold phone by IMEI, name or phone, or scan it

The last step shows **Return done** with the amount given back, the amount the shop cut, and the return number. Under it: **The phone is back in stock**. Tap **Another return** for the next one, or go Home.

What happens behind the screen

- The phone's status goes back to **In stock** and it can be sold again. Its history gets a **Sale returned** line with the person, amount and reason.
- The Rs. 2,000 the shop kept is counted as income. The day's hisaab shows **Given back on returns** (Rs. 35,000) and **Cut on returns** (Rs. 2,000) as separate lines, so the cash count still matches.
- The original sale is not erased. On the bill and in reports the returned line is crossed out and marked **Returned**.
- Any charger or cover you ticked goes back into the item's stock count.

Phone sold on udhaar

If the phone was sold on udhaar (credit) and the customer had paid nothing, the app shows **Nothing was paid for it; it comes off the udhaar**. No cash moves: the amount simply comes off what he owes you.

If he had paid part of it, only the part he paid can be given back; the unpaid part comes off his udhaar.

Example: Bilal bought a phone for Rs. 50,000, paid Rs. 20,000 and owes Rs. 30,000. He returns it. **Customer had paid** shows **20,000**. You give back Rs. 18,000 in cash and the shop cuts Rs. 2,000. His Rs. 30,000 udhaar for this phone is cleared.

Part back now, the rest later

For a known customer, under **Give back to customer (Rs)** type what you hand over now. **The rest, not handed back now** then asks where the rest goes: **Customer's khata (we owe)** keeps it as owed to him, **Shop keeps it (cut)** makes it the shop's cut. The dark card at the bottom says in words **To give to customer**, **To get from customer** or **Settled**.

Example: Ali paid Rs. 80,000. You give Rs. 30,000 now and tap **Customer's khata**: the card shows **To give to customer 50,000**. Later pay him from his khata (**Pay**), for example 20,000 and then 30,000.

Less credit than the bill price

If your return rules keep a part, change **Credit for what came back (Rs)** to less than the bill price. The difference is the shop's cut. If he still owed on that bill, the credit first clears that.

Example: bill Rs. 80,000, Ali paid Rs. 50,000 (owes 30,000). With the full credit of 80,000 the 30,000 is cleared and **To give to customer 50,000** remains. With a credit of only 25,000, **To get from customer 5,000** remains.

> **Tip:** A wrong bill cannot be edited, by anyone. If a sale was entered with the wrong price or phone, return it here and make a fresh bill. Both stay on the record, so nobody can quietly change a sale.

> **Note:** Scanning works on this screen. Scan the phone's barcode with a USB scanner and it jumps straight to step 2 for that phone.

10. Exchange

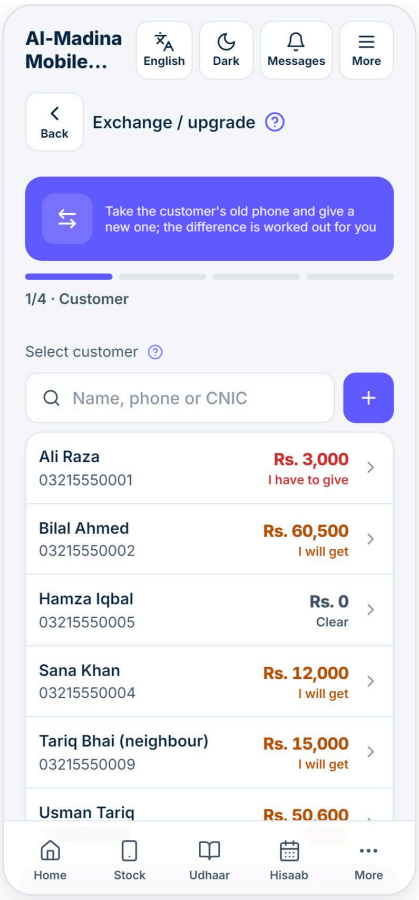

An exchange (also called an upgrade) is when a customer gives you his old phone and takes a newer one, paying the difference. The **Exchange / upgrade** screen does both jobs at once: it buys the old phone into your stock and sells the new one, and works out the difference for you.

It has four steps: **Customer**, the old phone, the new phone, and **Settle**.

Do an exchange, step by step

Example: Bilal Ahmed brings his old **Oppo A17**. You value it at **Rs. 18,000**. He takes an **Infinix Note 40** priced at **Rs. 54,000**. The difference is Rs. 36,000. He pays **Rs. 30,000** now, and **Rs. 6,000** goes on his khata.

1. Go to **More → Exchange (old for new)**. The screen is titled **Exchange / upgrade**.
2. Step **1/4 · Customer**: under **Select customer** search by name, phone or CNIC, and tap **Bilal Ahmed**. If he is new, tap the **+** button and add him. Each name shows his current balance, for example **I will get** (he owes you) or **I have to give** (you owe him). Tap **Next**.
3. Tap **Add the old phone**. Fill it in just like buying a phone: IMEI **358812091717195**, brand **Oppo**, model **A17**, storage, colour, condition and PTA status. In **Cost price** type **18000**: this is the trade-in value. Put an **Asking price** if you already know what you will sell it for, for example **22000**. Tap **Add**, then **Next**.
4. The old phone now shows as a card with its trade-in value. If you made a mistake, tap **Change the old phone**.
5. **Pick the new phone from stock**: tap the **Infinix Note 40**. Check the **Sale price** (**54000**) and tap **Next**.
6. **Settle** shows both phones, then **New device** 54,000, **Trade-in value** minus 18,000 (and **Previous balance** if he already owed you something), and a coloured card that says in words: **Customer pays the difference Rs. 36,000**.
7. Type **Paid now**: **30000**. Under it the app reminds you: **Less than that: the rest goes on their khata. New balance** shows his whole khata after this exchange: if he owed nothing before, it shows **6,000**.
8. Tap **Complete exchange**.

Picture 18: Exchange / upgrade, step 1: choose the customer

The screen shows **Exchange complete** with buttons to print the receipt (80mm thermal or A4), download or share it, **Open the bill**, or start **Another exchange**.

When the old phone is worth more

Sometimes the customer's phone is worth more than the one he takes. Then the card says **You give back the difference**, and the summary shows **Refund to customer**. If the two are equal it says **Nothing to pay either way**.

When the shop owes the difference you may pay all of it now, part of it, or nothing: change **Shop pays now (Rs)**. What is not paid stays in the customer's khata and the dark card says **To give to customer** with the amount. When the customer owes, a smaller **Paid now** leaves **To get from customer**. For money paid now choose how it moved: **Cash**, **Online** or **Cheque**.

If the old phone is one your shop sold him earlier, the exchange keeps that first sale, brings the phone back into stock at the agreed value and links the first bill (**First bill** on the done screen). The printed bill shows **Old phone taken back** with the exchange number, **Paid now**, and at the bottom **To get from customer** or **To give to customer**.

Example: Ali bought a phone for 80,000. You take it back at 70,000 and he takes one for 55,000; the shop owes 15,000. You pay 5,000 now: **To give to customer 10,000**. Later pay him 4,000 and then 6,000 from his khata.

After the exchange

- The old phone is now in your stock, bought from Bilal at Rs. 18,000. It has its own page and history like any purchase.
- Because the old phone came from a customer, do its **ID card check** (CNIC, declaration and so on) exactly as you would for any used phone you buy. For used tablets and watches, do the lock check too.
- The new phone is sold on a normal bill. Profit, the day's hisaab and Bilal's khata are all updated in one go.

> **Tip:** Agree the trade-in value with the customer before you start. The value you type in **Cost price** becomes that phone's buying price, so your profit on it later is worked out from this figure.

11. Stock, IMEI check and phone history

Everything you own sits in **Stock**. From here you can see what your stock is worth, find any phone in seconds, check whether an IMEI has been in your shop before, and open a phone's full life story from the day it came in.

What is my stock worth?

Tap **Stock** on the bottom bar. The first screen is **What is my stock worth?** Open a brand and tap a model: the stock list shows that model only (iPhone 17 does not bring iPhone 17 Pro Max); **Show all** removes it.

- At the top: how many phones you have and their total value (shown in lakh when it is large).
- Below: one row per brand, with how many phones and their value. Tap a brand to see its models.
- **See all phones** opens the full stock list. **Download** gives you the same figures as a file.

The value is at cost for the owner and manager. Staff who are not allowed to see buying prices see it at the asking price instead.

The stock list

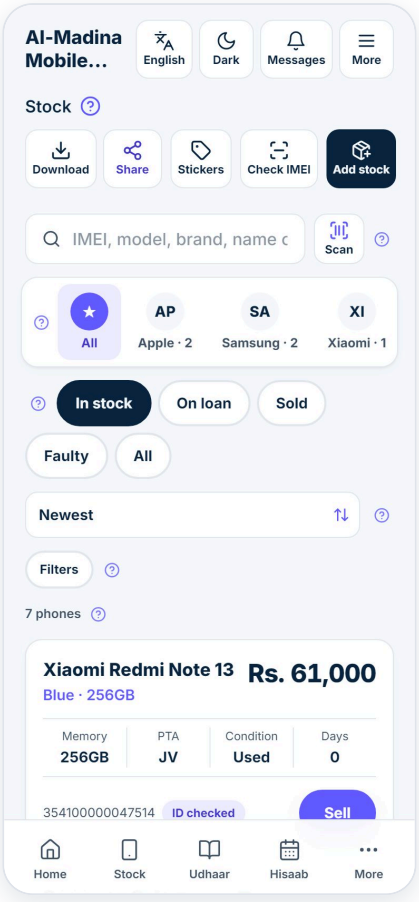

Open it with **See all phones**, or **More → Stock list**.

At the top are five buttons: **Download**, **Share**, **Stickers**, **Check IMEI** and **Add stock**. Under them:

- **Search**: type an IMEI, model, brand, or the name or phone number of the person you bought it from or sold it to. Tap **Scan** to use the camera, or simply scan with a USB scanner.
- **Brand circles**: **All**, then one circle per brand with its count (for example **Apple · 2**, **Samsung · 2**). Tap one to see only that brand.
- **Status chips**: **In stock**, **On loan**, **Sold**, **Faulty** and **All**.
- **Sort**: **Newest**, **Oldest first**, **Price: low**, **Price: high**.
- **Filters**: opens more choices: **Grade** (Used A, Used B, Refurbished, Copy / China), **RAM (GB)**, a price range (lowest and highest asking price), and a switch **Lock not checked** that shows only used devices whose lock check was never done.
- **Kind of stock**: **All stock**, **Mobiles**, **Tablets**, **Smartwatches** filter this list. **Accessories**, **Spare parts** and **Other** open the items screen (items are counted by quantity) with that kind picked.
- **Status cards**: **Available to sell** (in stock and ready to sell; under it **On hand**, every unit the shop holds), **With customer (approval)**, **Inspection** (ID check pending or flagged, or a lock still on), **In repair**, **Damaged / faulty**, **Low stock** and **Out of stock** for items (by each item's own reorder level), and **Value at cost** for the owner and manager. Tap a card to see only those units; tap it again to show all. Looking never changes anything.
- More **Filters**: condition, PTA, stock age (30+ / 60+ / 90+ days), **Bought from** (dealer) and, for the owner and manager, a cost range.
- Open a phone and come back: the kind, card, status, filters and sort you chose are still on.

- **Cards / Table / Grid / List**: how the phones are shown. **Cards** are the big cards described below. **Table** is like Excel: one row per phone and a column for each detail (memory, colour, condition, PTA, battery, IMEI, days, cost for the owner and manager, asking price, status). Tap a column heading to sort by it, and tap it again to reverse the order. The last row adds up cost and asking price; on a phone, slide the table sideways. **Grid** shows small tiles, many on one screen. **List** gives one short line per phone. The app remembers your choice on that phone or computer.
- **Fields**: tick which details show (memory, colour, condition, PTA, battery, region, IMEI, days, cost, asking and more). The choice applies to all four views. **Download** and **Share** sit next to it and make the PDF / Excel / CSV with exactly these columns, your filters and the same order.

Under the filters the app shows how many phones match, for example **7 phones**. Each phone is a card with its name, colour and storage, the asking price, and four small boxes: **Memory**, **PTA**, **Condition** and **Days** (how many days it has been in the shop). At the bottom are the IMEI, the ID check badge and a **Sell** button.

Picture 19: The stock list with search, brand circles, status chips and filters

Tablets and smart watches in the stock list

Tablets and smart watches live in the same stock as phones. Their cards show what matters for that type: a watch shows its case size and **GPS** or **SIM**; a tablet shows **Wi-Fi** or **SIM**. A device without a SIM has no IMEI, so its **Serial number** is shown and searched instead.

- To see only one type when selling, use the chips **All · Mobile · Tablet · Smart watch** above the stock on the sale screen.

- For a count and value by type, go to **Reports** → **By type** (**Stock by type**): units, value at cost and at asking price, how many are used, how many have the lock not checked or still on, how many are Non-PTA / JV, and how many are older than 60 days.
- If a device was entered as the wrong type (a tablet saved as a mobile, for example), the owner can tick it in the stock list and use **Change type**. History, IMEI or serial, barcode and balances stay exactly the same; only the type changes, and the change is written in the history.

Check an IMEI ("has this phone been here before?")

Before you buy a used phone, it is worth checking whether it has passed through your shop before.

1. In the stock list tap **Check IMEI** (or **More** → **IMEI search**).
2. Type the 15 digits, or tap **Scan** and point the camera at the IMEI barcode on the box. You can also dial ***#06#** on the phone and scan the screen.
3. The answer is one of these:

What you see	What it means
New IMEI, not seen before	This phone has never been in your shop.
This IMEI has been in your shop before · Bought 1 time(s)	You have bought this phone before. Tap it to open its full history: who sold it to you, who you sold it to, and so on.
IMEI check digit is wrong, re-check	The number is mistyped. Every real IMEI has a last "check digit"; this one does not match.

> **Tip:** A phone you sold six months ago coming back for sale is normal. A phone you sold yesterday coming back from a different person is worth a question.

A phone's own page

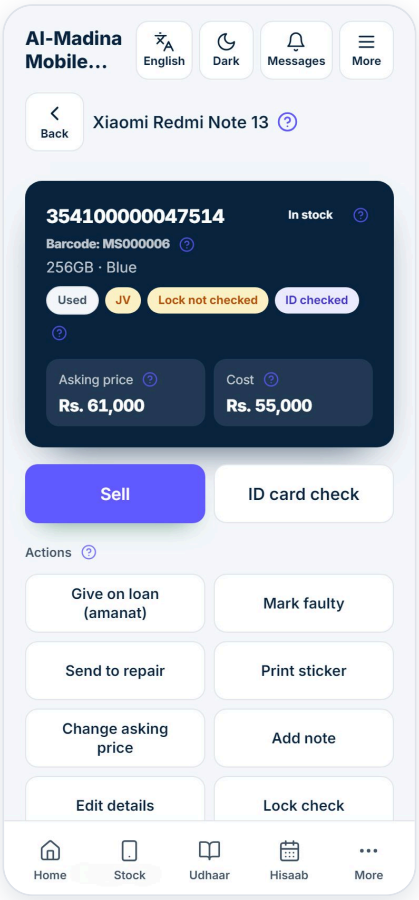

Tap any phone in the stock list to open its page. The dark card at the top shows:

- the IMEI (or serial) and the status, for example **In stock**, **On loan**, **Sold**, **In repair** or **Faulty**;
- **Barcode** (for example **MS000006**), storage and colour;
- badges for condition (**Used**, **Box pack**...), PTA (**PTA approved**, **Non-PTA**, **JV**), the lock check (**Lock not checked** or **Locks cleared**) and the ID check (**ID checked**, **ID check pending**);
- **Asking price** and, for the owner and manager only, **Cost**.

Under the card are the two main buttons, **Sell** and **ID card check**, and then **Actions**:

Button	What it does
Give on loan (amanat)	Give this phone to another shop (chapter 15).

Button	What it does
Mark faulty	Choose what is wrong (Camera, LCD, Display, Dots on display, Board, RAM, Battery and more), or write your own fault and tap **+** (it is offered next time too). The phone stays in the stock list with a red **Faulty: …** tag and can still be sold as it is; the bill says **Sold as faulty**. **Change faults** edits the list; **Faulty cleared** when it is fixed.
Send to repair	Open a repair job for your own phone (chapter 14).
Print sticker	Print its price sticker with barcode (chapter 12).
Change asking price	Set a new asking price; the old one stays in the history.
Add note	Write anything you want to remember, with your name and the time.
Edit details	Correct storage, colour and similar details.
Lock check	Record the iCloud / Google (FRP) / account lock checks for a used device.
Return	Shown on a sold phone: start a return (chapter 9).

Picture 20: A phone's own page: IMEI, barcode, badges, asking price and cost, and the action buttons

Money on this phone

Further down the page is the card **Money on this phone**. It answers "what did this phone cost, what did it sell for, and is anything still pending?"

- **Cost**, **Still to pay**, **Sold for**, **Still to get** and **Margin** in one row.
- **Bought from**: who sold it to you, the purchase bill, the agreed price, what you paid at the time, every later payment, and what is still to pay.
- **Sold to**: the same for the sale: agreed price, **Received at the time**, later payments, and what is still to get.
- **Pay for this phone** and **Receive for this phone**: take a payment that is booked against this very bill, so the phone's figures and the person's khata move together.

A person's phones by brand and model. On a customer's or dealer's page, **Phones** shows the totals first: phones bought from them and sold to them, **Still to pay** and **Still to get**. **By brand and model** (the usual view) lists each brand with how many and what is left to give / to get; tap it for its models, each with the same figures; tap a model for its phones. **Pay money** / **Receive money** on a brand or a model pays all its open bills at once, oldest first; each phone keeps its own button too. Tap a phone for its page, with its own money ledger and history; the person's whole khata stays under **Khata history**. **One list** shows every phone in one list as before.

Example: you bought a Vivo from Ahmed for Rs. 35,000 and paid Rs. 30,000 (you owe him Rs. 5,000). You sold it to Bilal for Rs. 40,000 and he paid Rs. 35,000 (he owes Rs. 5,000). Later you pay Ahmed Rs. 2,000 and Bilal pays you Rs. 3,000. The card now shows cost 35,000, still to pay 3,000, sold for 40,000, still to get 2,000, margin 5,000. Ahmed's and Bilal's khata pages show exactly the same numbers.

If the phone was entered as old stock, the card says **Old stock: entered with its cost, no purchase bill.**

> **Note:** Buying figures (cost, what you owe the seller, margin) are shown only to the owner and manager.

An IMEI or the seller typed wrong

Only the owner or manager can put these right, and each needs a short reason. Nothing is deleted: the phone's **History** shows a **Corrected** line with the old value, the new one and the reason.

- **Wrong IMEI:** open the phone, tap **Correct IMEI**, type the right IMEI 1 (and IMEI 2, or tick that the phone has no IMEI 2), write the reason and tap **Save**. The number must be 15 digits and not belong to another phone in the shop. The barcode stays the same.
- **Wrong dealer or customer:** open the purchase (**More → Purchases**, or tap the purchase line in the phone's history), tap **Change dealer / customer**, pick the right person, write the reason and tap **Save**. The bill and what was paid with it move to the right person's khata; the wrong person's khata is back to what it was. This is not possible once money was paid later against that bill or something was returned on it: undo that first.

- **Entered as paid, but it came on udhaar (or the other way round):** open the purchase (or the phone, even a sold one) and tap **Change what was paid**. Tap **Nothing paid (all udhaar)**, **Paid in full**, or type what was really paid at the purchase; if more was paid, choose how (cash, online, cheque). The sheet shows the effect, e.g. "Rs. 20,000 goes back into the money account; the dealer's khata: Rs. 20,000 more to give". Add the promised date if you like, write the reason and tap **Save**. Payments made later against the bill stay; the phones are not touched. Owner or manager only. If that day's cash is already closed, the change is dated today.
- **Wrong purchase price:** open the phone, tap **Change purchase price**, type the right price, write the reason and tap **Save**. The sheet shows what it does to the seller's khata, for example "2,000 more to give". The bill's total, the stock value and the phone's cost follow; cash does not move; the history keeps the old price. Only the owner or manager, and only while the phone is still in the shop (not sold).

Reserve a phone or items for a customer

On a phone's page tap **Reserve for a customer**, pick the customer, and if you like **Hold until** and a note (for example "advance 5,000"). The page then shows **Reserved for** with the name. The phone stays in stock but is not counted under **Available to sell**, the stock screen has a **Reserved** card, and the sale refuses it for anyone else. Selling it to that customer ends the hold by itself; if they do not come, tap **Release**. On an item's page, **Reserve for a customer** asks **How many**: others can then buy only the pieces that are free. Nothing is charged or posted; the phone's history shows **Reserved** and **Reservation released**.

Shelf / place

When adding or editing a phone, **Shelf / place** (optional) says where it sits, for example **Rack A2**. It shows on the phone's line, and the stock search and the **Shelf / place** filter find it.

Change who it was bought from

On a phone's page tap **Change dealer / customer**: its purchase opens with the change ready (see "An IMEI or the seller typed wrong" above). For items, open the purchase from the item's movements or **More → Purchases**.

Page style: Classic, Smart, Tabs, Tiles, Compact

At the top of a phone's page you can choose how it looks. The choice is remembered on that phone or computer.

- **Classic**: the page as before.
- **Smart**: every fact has its action beside it. **Copy** and **Correct IMEI** sit beside the IMEI, **Change asking price** beside the price, **Edit** beside the shelf, **Print sticker** beside the barcode and **Verify** beside the ID check. **Sell** is at the top. The person it was bought from (or sold to) shows with what is still owed and **Pay** / **Receive**, **Open bill** and **Change**. The history is below.
- **Tabs**: the same page split into **Phone**, **Customer & money** and **History**.

- **Tiles**: big squares; tap one to change it (price, IMEI, condition, shelf, sticker, ID check).
- **Compact**: one short list, with **Sell** pinned at the bottom.

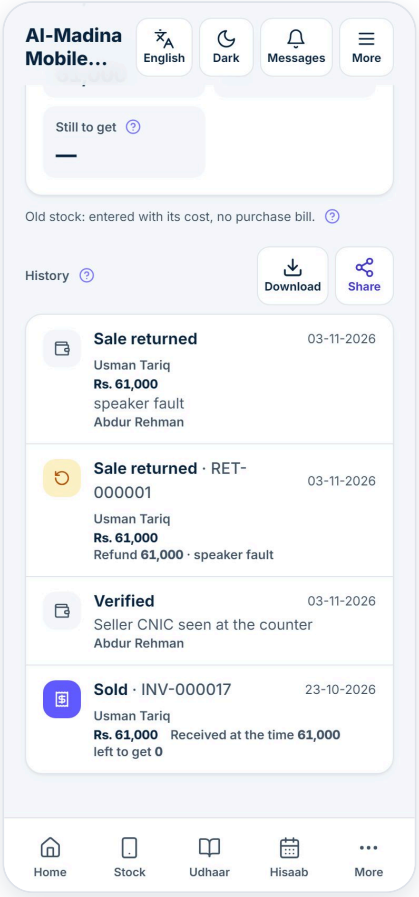

Every style does the same things; any action not shown beside a value is under **More actions**.

The full history

At the bottom of the page is **History**: one timeline of everything that ever happened to this phone, newest on top. Every line has the date, the person, the amount and the staff member who did it. You will see lines such as:

- **Purchased** (with the bill and who you bought it from) and **Barcode assigned**;
- **Verified** (the ID check, for example "Seller CNIC seen at the counter");
- **Price changed** (old and new asking price);
- **Sold** with the invoice number (for example **INV-000017**), **Received at the time** and **left to get**;
- **Sale returned** with the return number (for example **RET-000001**), the refund and the reason;
- **Loaned out**, **Loan returned**, **Sent to repair**, **Back from repair**, **Marked faulty**, **Label printed**, **Note**.

History lines can never be edited or deleted. A mistake is corrected by a new line, so the timeline always tells the true story. Tap **Download** or **Share** above the history to send it as a file, for example to a customer who wants proof of where a phone came from.

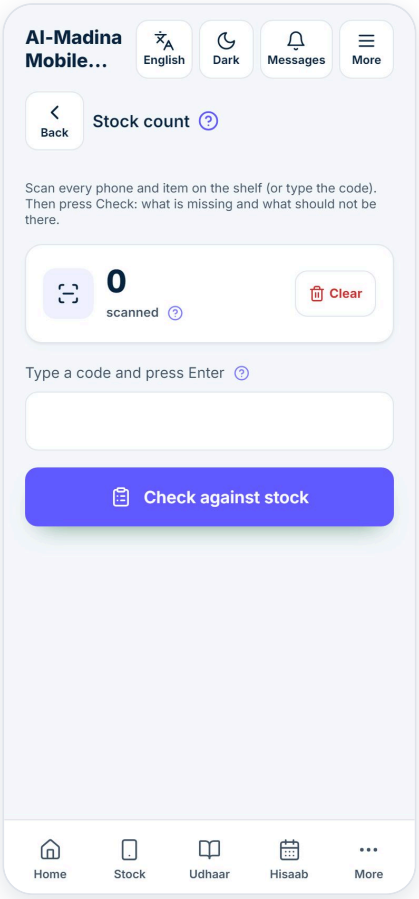

Picture 21: A phone's history: sold, verified, sale returned, each with date, person and amount

Stock count with the scanner

Once a month (or whenever you feel something is missing) count the shelf with the scanner. The app tells you what is missing and what should not be there.

1. Go to **More** → **Stock count**. (Owner and manager.)
2. Scan every phone and every item on the shelf, one after another. A USB or Bluetooth scanner is fastest, but you can also type a code in **Type a code and press Enter**. The big number shows how many you have **scanned**.
3. Scanning the same box of chargers five times counts five pieces.
4. When the shelf is done, tap **Check against stock**.
5. The result has three lists: **Found** (scanned and in stock), **Missing** (should be in stock but was not scanned) and **Should not be here** (scanned, but the app says it is sold, on loan, or not known at all). For items you see **scanned 8 of 10** and whether it **matches** or **differs**.
6. Tap any phone in the lists to open its page and sort it out. **Clear** or **Start a new count** begins again.

Picture 22: Stock count: scan everything, then Check against stock

Example: the app says **12 phones should be in stock.** You scan 11. **Missing** shows one Samsung A15. You open it and see in its history **Loaned out** to Star Mobiles yesterday, but it was never marked. Or it really is missing, and now you know which one.

> **Tip:** Do the count before opening or after closing, when no sales are happening. A phone sold while you are counting will show up as "missing".

Sending stock to another branch

If you have more than one branch, you can move phones and items between them. Nothing is sold: the stock leaves this shop at its buying price and arrives in the branch at the same price, so profit does not change.

1. Open the phone and tap **Send to another branch** (or open an item and tap the same button, or go to **More** → **Branch transfers** → **Send to a branch**).
2. Under **Send to**, tap the branch.
3. Tap **Add a phone** to add more phones (search or scan the IMEI or barcode), and **Add an item** for chargers, covers and other items. Use **+** and **–** to set how many pieces go.
4. Check **Stock value moving (at cost)** at the bottom, then tap **Send now**.

Example: Saddar sends a Galaxy A04 (bought for Rs. 40,000) and 2 chargers (Rs. 900 each) to Mall Road. Saddar's stock goes down by Rs. 41,800 and Mall Road's goes up by Rs. 41,800.

- In this shop the phone shows **Sent to a branch**; its whole history stays here.
- In the branch it is in stock with the same IMEI, barcode and selling price, and its first line says it came from your other branch.
- **More** → **Branch transfers** lists everything sent and received, with a number like TRF-000001.

> **Note:** Only the owner and the manager can send stock, and only to branches they also work in. The button shows only when you have more than one branch.

12. Price stickers, barcodes and scanning

Every phone and every item in Mobile Shop gets its own barcode the moment it is bought. You print it on a small price sticker, stick it on the box, and from then on one scan finds the phone: at the counter, in a return, in a stock count. No more typing 15-digit IMEIs.

How barcodes are given

- When you add stock, each phone gets a barcode like **MS000006** (your shop's prefix plus a number). Items such as chargers get one barcode per item, not one per piece.
- The barcode never changes and is never given to anything else. If you sell a phone and later buy it back, it keeps its old barcode.
- The barcode shows on the phone's page under the IMEI (**Barcode: MS000006**) and on each item's row.
- A box that already has the maker's barcode can use it too: when buying, scan it into **Maker's barcode (optional)**. You can also type your own code in **Own barcode (optional)**.

Print a price sticker

You can print stickers from several places:

- **One phone**: open its page and tap **Print sticker**.
- **Many phones**: in the stock list tap **Stickers**, tick the phones (or **Select all**), then tap **Stickers (n)**.
- **Right after buying**: the purchase result has **Print stickers for these phones** (and **Print item labels** for items).
- **An item**: open the item's page and tap **Print sticker**. Use copies for a whole box of chargers.

The sticker sheet then asks a few things once:

1. **Sticker size**: roll sizes such as 38×25, 40×30, 50×25, 50×30, 58×40, 60×40 and 70×40 mm for label printers, **A4 sheet (65 per page)** for an ordinary printer, or **Custom mm** with your own **Width (mm)** and **Height (mm)**. A sticker under 22 mm high prints the phone name, price, a large barcode and the IMEI only, so they fit.

> **58 mm Bluetooth printer (e.g. MPT-II) with a 56–58 mm roll:** the printer prints 48 mm wide (203 dpi, 384 dots), so use **Custom mm**, **Width 48**. Height: 30 for the full sticker, about 18 for a short one. On Android, print through the **RawBT** app: the free version adds its own lines; the paid version does not.

1. **What goes on it**: tap a line to switch it on or off: **Shop name**, **Model**, storage and colour, **Price**, **Barcode**, **IMEI number**, **IMEI last 4**, **Condition**, **PTA**, **Date** and **Cost code**.
2. **Copies of each**: how many stickers per phone or item.
3. Tap **Print**. The page is already exactly the size of one sticker, so a label printer prints one per sticker. You can also download or share it as a PDF.

Tick **Remember these choices** and the shop will use the same size and lines next time.

Example: you want a clean sticker for the front of a box. Choose **50×30** and switch on only **Shop name**, **Model**, storage and colour, **Price** and **Barcode**. The sticker reads *AL-MADINA MOBILE ZONE · Xiaomi Redmi Note 13 · 256GB · Blue · Rs. 61,000* with the barcode **MS000006** under it.

Picture 23: A printed price sticker: shop name, model, storage and colour, price, and the barcode

The cost code (owner's secret)

Some shops like to see the buying price on the sticker, but in letters a customer cannot read. Set it in **Shop settings → Sticker cost code**: type a word with 10 different letters, for example **BLACKHORSE**. Digit 0 is the 1st letter, 1 the 2nd, and so on. A phone that cost Rs. 45,000 then prints as **KHBBB**.

> **Important:** Only the owner and manager can put the cost code on a sticker. If a salesman switches it on, it is simply left off.

Barcode settings (owner)

More → Settings → Barcode settings is where the owner sets up barcodes. Most shops never need to change anything here.

- **Barcode type for new labels**: **Code 128** (reads on every scanner, the default), **EAN-13** (digits only) or **QR** (for 2-D scanners and phone cameras). Old labels keep working when you change it.
- **Shop prefix** and **Start numbering from**: the letters and number new barcodes start with.
- **Value**: **Prefix + number (MS000123)** or **The phone's IMEI**.
- **Test print** and **Test scan**: print a test sticker, then scan it into the **Scan here** box. It should show the phone or item it belongs to.
- **Barcodes for old stock**: if you used the app before barcodes came, tap this once to give every old phone and item a barcode. Then print their stickers from the stock list.

Scanning with a USB or Bluetooth scanner

Any ordinary barcode scanner works. Plug it into the computer's USB port (or pair the Bluetooth one). No driver or setup is needed.

The scanner must type the code and press Enter by itself. Test it once in Notepad: scan a barcode and the code should appear, followed by a new line. If it does not, scan the "add Enter / CR suffix" code in your scanner's little manual.

You do not need to click in a box first. Just scan, wherever you are in the app. It even works when the Urdu keyboard is switched on.

Scanning with the phone camera

On a phone, tap any **Scan** button (next to the search boxes, and in the IMEI boxes when buying). The camera opens: point it at the barcode and hold steady in good light. If the camera does not open, tap **Take a photo instead** and take a picture of the barcode.

For an IMEI, point at the IMEI barcode on the box, or dial ***#06#** on the phone and scan the screen. If IMEI 1 is already filled, the app asks you to point at the IMEI 2 barcode.

What a scan opens

The app understands its own barcodes, IMEI 1, IMEI 2, item codes and maker's barcodes. What happens depends on where you are:

Where you are	What a scan does
Home, or most screens	Opens the phone's or item's page. A sold phone opens its history.
The sale screen	Puts the phone on the bill at its asking price. Scanning an item adds 1; scan it again and the quantity becomes 2.
The return screen	Finds the sold phone and goes straight to its bill.
Buying stock	Fills IMEI 1, then IMEI 2, then the maker's barcode.
Stock count	Counts the phone or piece.
A repair sticker, anywhere	Opens that repair job (the **REP-** number, chapter 14).

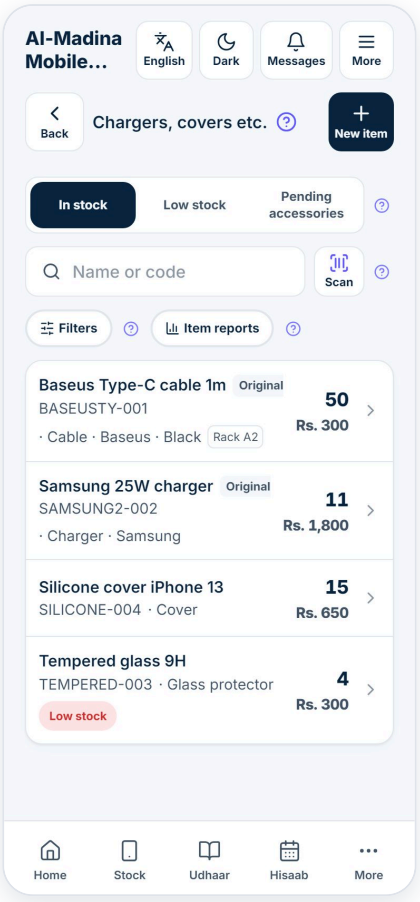

If the code is not known, the app beeps and shows **Item not found** with an **Add it** button.

> **Tip:** If a scan does nothing, the cursor may be inside a box on a form. Tap an empty part of the screen and scan again.

13. Accessories and items

Chargers, cables, covers, glass protectors, earphones, power banks, ordinary watches and similar things are kept **by count**: no IMEI, just how many you have. The app calls them items. You find them in **More → Accessories**, on a screen called **Chargers, covers etc.**

The screen has three tabs: **In stock**, **Low stock** and **Pending accessories**. Above the list are a search box (**Name or code**) with **Scan**, a **Filters** button (category, brand, quality, supplier, shelf, out of stock) and **Item reports**. Each row shows the item's name, its quality (for example **Original**), its code (for example **BASEUSTY-001**), category, brand, colour, shelf (**Rack A2**), how many are left and the sale price. A red **Low stock** badge appears when it is running out.

Picture 24: Chargers, covers etc.: items with count, price, shelf and the low-stock badge

A few simple rules

- **The count is always in pieces.** You may buy in dozens, boxes or cartons, but stock is kept in pieces.
- **The sale price is the price of one piece** to an ordinary customer.
- **Every purchase is kept as its own batch** with its date, supplier, quantity and cost. When you sell, the oldest batch is used up first.
- **Nothing on an item is ever deleted.** If the count is wrong, you adjust it with a reason, and the adjustment is written in the history.

Add a new item

Example: Baseus Type-C cable 1m, sale price Rs. 300 each, never below Rs. 200, warn when 20 are left.

1. In **Chargers, covers etc.** tap **New item**.
2. Type the **Name**: **Baseus Type-C cable 1m**.
3. Pick the **Category**: **Cable**. The list has charger, cable, cover, glass protector, earphones, power bank, watch, speaker and more, and you can add your own kind.
4. Type the **Sale price**: **300**.
5. Type **Reorder at**: **20**. This is your low-stock warning.
6. If you already have some on the shelf, type **Opening qty** and **Cost each**.
7. Tap **More details** if you want to fill in more. All of it is optional: **Brand**, **Fits (phone / model)** (for example "iPhone 14/15, Samsung A series"), **Quality** (Original, Company / OEM, A-grade, Copy / China, Used), **Colour**, **Size**, **Capacity (mAh / GB)**, **Connector**, **Watts**, **Wholesale price**, **Minimum sale price** (**200**), **Promo price** with its dates, **Warranty (days)**, **Shelf / rack**, **Maximum stock**, **Supplier codes** and **Notes / description**.
8. Tap **Save**. The item gets its own code and barcode straight away.

If a very similar item already exists, the app shows **Similar items already in stock**, so you do not make the same item twice.

> **Tip:** Keep the form short when you are busy. Name, price and quantity are enough; you can fill in the rest later with **Edit** on the item's page.

Buying items in pieces, dozens or boxes

Items are usually bought from a dealer, often on the same bill as phones.

1. Tap **Add stock** and choose the dealer.
2. Tap **Add accessory / watch**.
3. Pick the item from the list, or tap **New item (not in the list)**, fill in its name, what it is and the selling price each, and tap **Save and add**.
4. Tap the unit you bought in: **Piece**, **Dozen**, **Box** or **Carton**. Type how many and the price you paid for one unit.
5. The app works out the cost of one piece for you: 3 dozen at Rs. 1,200 a dozen becomes 36 pieces at Rs. 100 each.
6. If you like, fill in the supplier's bill number and any freight or loading charge. Freight is spread over the lines and added to the cost.
7. Save the purchase as usual (paid now, the rest on the dealer's khata). On the result screen tap **Print item labels** if you want stickers.

How many pieces make a dozen, box or carton is set once in **Settings → Item settings**. A single item can have its own box size (**Pieces in one box (this item)**).

Batches and average cost

Each purchase is a batch. The item's page lists every batch with the supplier, the date, how many were bought, how many are **left**, and the cost of one piece.

Example: you bought 3 dozen Baseus cables from Rehman Traders at Rs. 100 a piece, and later 2 dozen more at Rs. 120 a piece. You now have 60 pieces and the **Avg cost** is **Rs. 108**. You sell 10 pieces: they come out of the older Rs. 100 batch first, so it shows **26 / 36 left** and the newer batch still shows **24 / 24 left**.

The owner chooses how stock is valued in **Settings → Item settings → Stock valuation**: **Weighted average** (the default) or **FIFO (oldest first)**, where each sale is costed from the batch it actually came out of.

Selling items

1. In **Sell**, tap **Accessory / watch**. The same button appears under a phone, so you can sell a charger or cover with it.
2. Tap the item, or simply scan its barcode. Scan again to add one more.
3. The line shows how many are in stock. The price is filled in for you: the retail price for an ordinary customer, the **Dealer price** if the customer is marked as a dealer, or the **Promo** price while a promotion is running.
4. Change the quantity or price if needed, and complete the sale as usual.

The count goes down and the profit is worked out from the cost.

Some guards protect you:

- You cannot sell more than you have (**More than in stock**), unless the owner has switched on **Allow selling past zero stock** in Item settings.
- Selling under the **Minimum sale price** shows **Below the minimum price — needs the manager**. It follows the same price rule as selling a phone under its asking price (see chapter 15).
- Selling below cost needs the owner.

> **Note:** The sale screen also has **+ Charger, cover or other item**, a free line where you just type a name and a price. It is fine for a one-off, but it does not touch any item's stock count. For anything you keep in stock, always use **Accessory / watch** or scan it.

Pending accessories

Sometimes a charger or earphones are promised but not handed over yet. The **Pending accessories** tab keeps them so nothing is forgotten:

- **From vendor**: the dealer still owes you something, for example the charger for a Galaxy A55, with the date he promised.
- **To customer**: you promised the customer something, for example earphones with a Vivo Y36.

They come from the questions **What came with the phone?** (when buying) and **What goes with the phone?** (when selling), where you answer **Later** for a thing still to come. When it is handed over, tap **Delivered**.

Stock alert (low stock)

Every item has a **Reorder at** level. When the count falls to that level or below:

- the item shows a red **Low stock** badge and appears in the **Low stock** tab;
- Home shows "N items low on stock" under *Needs attention*, and tapping it opens the Low stock tab;
- the owner's night report lists the items that are low.

Item reports → **Low stock** goes one step further: it groups the low items by their last supplier and suggests how many to order, with an estimated cost, so you can phone the dealer with a ready list. The other item reports show **Stock value** (at cost and at sale price), **Fast / slow** movers, **Profit** by category and by brand, **Dead stock** (not sold for a number of days) and **Suppliers**.

Adjust stock (damage, loss, count correction)

The count should only change by buying, selling and returning. When a piece breaks, goes missing, or the shelf count differs, adjust it:

1. Open the item and tap **Adjust stock**.
2. In **Change (+/−)** type the change, for example **-2** for two broken covers.
3. In **Reason (required)** write why, for example **damaged** or **count correction**. The app will not save without a reason.
4. Tap **Save**. The history shows an **Adjusted** line of −2 with your name, the time and the reason.

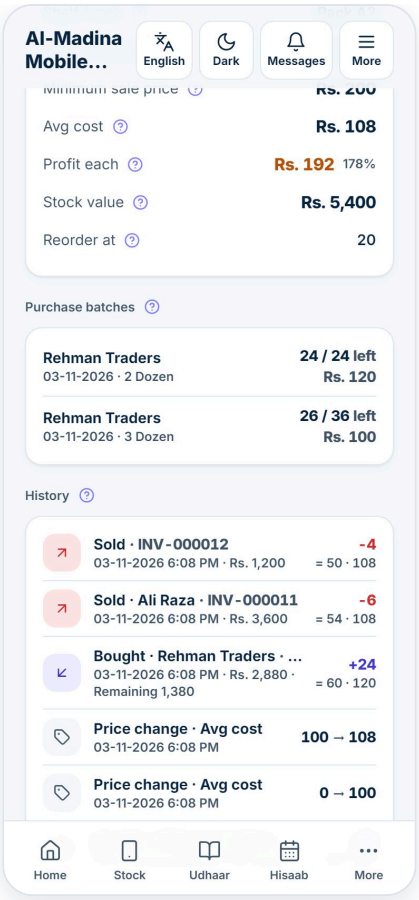

The item's page

Tap any item to open its page. It shows:

- the details: **Sale price**, **Wholesale price**, **Minimum sale price**, **Avg cost**, **Profit each** (with the margin %), **Stock value**, **Reorder at** and **Shelf / rack**;
- **Purchase batches**: each purchase with the supplier, date, pack (for example **3 Dozen**), how many are left and the cost;
- **History**: every movement with its date and amount: **Bought** (from whom, how much, what is still to pay), **Sold** (to whom, with the invoice number), **Returned**, **Adjusted**, **Used in repair**, and **Price change** lines for the sale price, minimum price and average cost. On the right of each line you see the change (for example **−4**) and the count after it.

Buttons on the page: **Print sticker** for everyone, and for the owner and manager **Adjust stock**, **Edit** and **Delete** at the top (an item you no longer sell; its past bills and history stay).

In our cable example the page shows **Avg cost Rs. 108**, **Profit each Rs. 192** (178%) on a Rs. 300 sale price, and **Stock value Rs. 5,400** for the 50 pieces left.

Picture 25: An item's page: average cost, profit each, stock value, purchase batches and history

Tip: To change many prices at once (for example all chargers up by 10%), open **Item reports** and tap **Change prices**. Type **+10** to raise by 10% or **−5** to lower by 5%, or an amount in rupees. Every change is kept in each item's history.

14. Repairs and repair labs

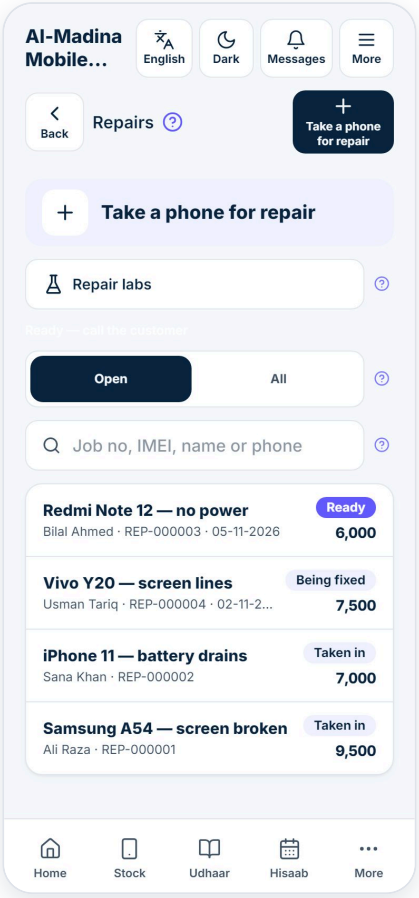

The repairs module follows a customer's phone from the moment it comes over the counter until it goes back in his hand: what is wrong, what you promised, how much advance he gave, whether it went to an outside lab, what the lab charged, and what he paid at the end.

Every job moves through four stages, shown as a bar on the job: **Taken in** → **Being fixed** → **Ready** → **Given back**. Each job gets a number such as **REP-000004**.

The repairs list

Open it from Home → **Repair**, or **More** → **Repairs**. At the top are **Take a phone for repair** and **Repair labs**. Under them:

- **Open** shows jobs not yet given back; **All** shows every job.
- The search box finds a job by **Job no, IMEI, name or phone**.
- Each row shows the phone and problem (for example *Vivo Y20 — screen lines*), the customer, the job number, the ready-by date, the stage (**Taken in**, **Being fixed**, **Ready**) and the amount.
- When a phone is at an outside lab, the row says **At lab** with the lab's name, in red if the lab is late.
- When jobs are ready, a line **Ready — call the customer** reminds you to phone them.

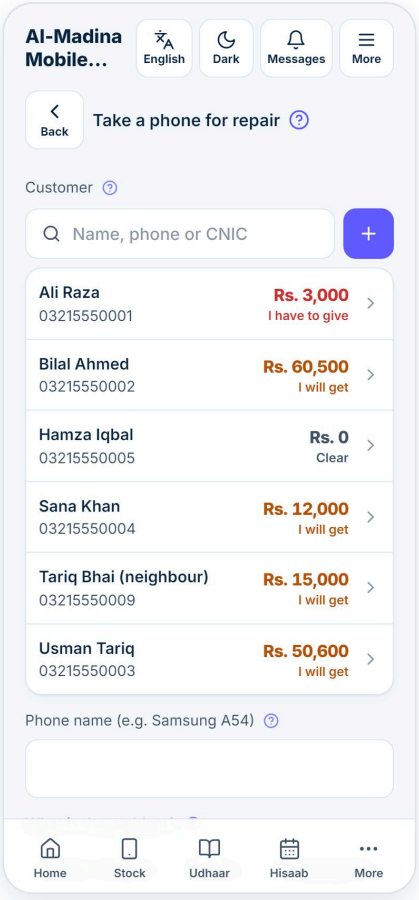

Picture 26: The repairs list: open jobs with stage and amount, and the Repair labs entry

Take a phone in

Example: Usman Tariq brings a **Vivo Y20** with lines on the screen. You think the bill will be about **Rs. 7,500**. He gives **Rs. 2,000** advance. You promise it in three days.

1. Tap **Take a phone for repair**.
2. Under **Customer** search by name, phone or CNIC and tap **Usman Tariq**. For a new customer tap **+** and type his name and mobile number.
3. In **Phone name (e.g. Samsung A54)** type **Vivo Y20**.
4. Under **What is the problem?** tap the matching problem chips (for example **Screen / display**). If his problem is not in the list, write it in **Other problem (write)**: **screen lines**.
5. Type **Likely cost**: **7500**, and **Advance taken**: **2000**.
6. Under **Ready by** tap **Today**, **Tomorrow**, **3 days**, or choose a date.
7. Tap **IMEI, things left with the phone** if you want to note the IMEI and what he left with it: SIM, memory card, cover, charger, box or earphones.
8. Tap **Save and print slip**. The customer's slip (the job sheet) prints, and the job opens.

Picture 27: Taking a phone in for repair: choose the customer, then the phone and problem

The advance is taken into your cash and counted against the job. If the customer never comes back for the phone, the record still shows exactly what he paid.

> **Tip:** Your own stock phones can be repaired too. Open the phone's page and tap **Send to repair**. The job is marked **Shop's own device**, and whatever the repair costs is added to that phone's cost, so its profit stays honest.

While you work on it

Open the job from the repairs list. Under the stage bar you have:

- **Start fixing**: the job moves to **Being fixed**.
- **Waiting for parts**: for example, the screen has been ordered from the market.
- **Could not fix**: closes the job without a repair (the phone is given back unrepaired).
- **It is fixed**: opens the bill (see below).

Lower down are **Print sticker** (the repair sticker), **Print slip** (the customer's job sheet again), and **Document language**, which chooses whether the printed slip is in English or Urdu.

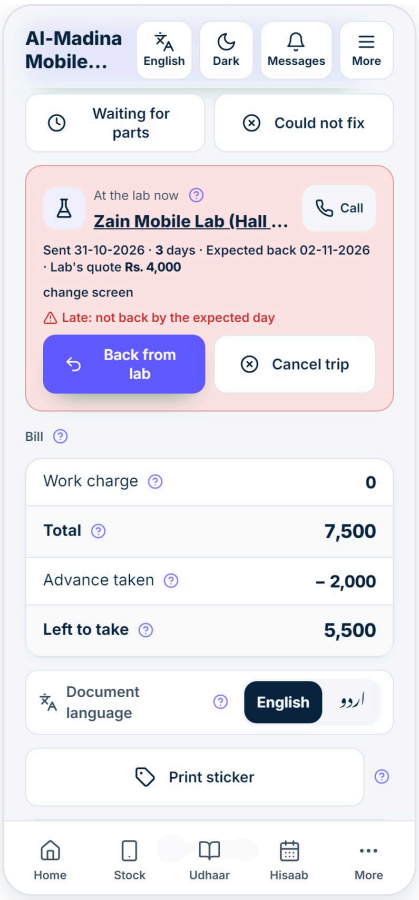

Send the phone to an outside lab

In the market, many shops do not fix everything themselves. A board fault or an iPhone screen often goes to a specialist lab or technician. Mobile Shop keeps a full record of every such trip: which lab has the phone, since when, what they must do, what they charged, and what the shop owes them.

Example (continued): your technician cannot fix the Vivo's screen. You give it to **Zain Mobile Lab (Hall Road)**. They quote **Rs. 4,000** and promise it back in two days.

1. On the job tap **Send to a lab**.
2. Under **Repair lab / technician** pick **Zain Mobile Lab (Hall Road)**. A new lab can be added right there with its name and phone.
3. In **What should the lab do** write the work, for example **change screen**.
4. Type the **Lab's quote**: **4000**. This is only for the record; the real charge is typed when the phone comes back.
5. Choose **Expected back**: the day the lab promised.
6. Tap **Send**.

The job moves to **Being fixed**, and a card **At the lab now** appears on it with the lab's name, a **Call** button, the date sent, how many days it has been there, the expected day and the quote. If the lab has not returned it by the expected day, the card turns red and says **Late: not back by the expected day**.

Picture 28: A repair job while the phone is at a lab: late warning, Back from lab and Cancel trip

Only one lab trip can be open per job. If you marked the wrong lab, or the lab never took the phone, tap **Cancel trip** and write the reason in **Why cancel?**. The cancelled trip stays in the history.

Bring it back from the lab

1. When the lab returns the phone, open the job and tap **Back from lab**.
2. Answer **Did the lab fix it?**: **Fixed** or **Not fixed**.
3. Type the **Lab's charge** for this trip: **4000**. Type it even if the lab could not fix it but took a checking fee.
4. In **Paid to the lab now** type what you paid in cash on the spot, for example **1500**. The app shows **Rs. 2,500 goes to the lab's khata (the shop owes it)**.
5. Tap **Save**.

If it was **Fixed**, the job becomes **Ready** and the customer gets the usual "your phone is ready" message. If it was **Not fixed**, the job stays open and you can send it to another lab.

Every trip is listed under **Lab trips** on the job: which lab, sent and back dates, fixed or not, and the charge. Nothing is ever deleted.

What happens to the lab's charge

- On a customer's phone, the lab's charge is a cost of that repair. Your repair profit is the bill minus parts minus lab charges.

- On your own stock phone, the lab's charge is added to that phone's cost.
- The charge is booked once, when the phone comes back. It is not booked again when you give the phone to the customer.
- What you did not pay on the spot sits on the lab's khata. Pay it later from the lab's khata with **Money paid**, like any other dealer.

Example: a phone goes to Ali Repair Lab, comes back **Not fixed** with a Rs. 500 checking fee, then goes to Zain Mobile Lab and comes back **Fixed** for Rs. 4,000. Lab trips shows both. The repair's lab cost is Rs. 4,500.

When it is fixed

1. Open the job and tap **It is fixed**. The sheet **Parts and work charge** opens.
2. Add the parts you used with **+ Part** (name, quantity, price). Tap one of the items from your stock under it to use it **From stock**: its count goes down by itself.
3. Type the **Work charge**. The **Total** is worked out as you type.
4. Tap **It is fixed**. The job shows **Ready** and the bill: total, minus **Advance taken**, equals **Left to take**.
5. Tap **Call** to phone the customer.

Example (continued): the bill for the Vivo is Rs. 7,500 work charge. Advance was Rs. 2,000, so **Left to take** is **Rs. 5,500**.

Give it back

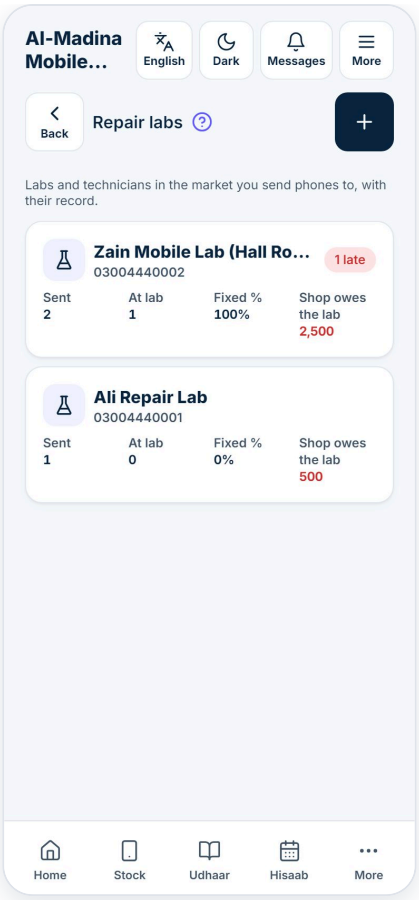

1. When the customer comes, open the job and tap **Give back to customer**.
2. Check the total, the advance and **Left to take**.
3. Type what he pays in **Taken now**: **5500**. If he pays less, the app says **The rest goes to the customer's khata**.
4. If you give a repair warranty, type **Warranty days (if any)**.
5. Tap **Give back to customer**. The job shows **Given back** and is closed.

In our example the shop billed Rs. 7,500 and the lab charged Rs. 4,000, so the profit on this repair is **Rs. 3,500**.

> **Note:** For your own stock phone that did not go through a lab trip, the give-back sheet also has **Paid to outside technician**, for a technician you paid without recording a trip.

Repair labs and their records

Tap **Repair labs** on the repairs list. You see every lab and technician you send phones to. Each card shows how many phones were **Sent**, how many are **At lab** now, the **Fixed %**, and what the **Shop owes the lab**. A red badge such as **1 late** warns you that a lab is holding a phone past its promised day. Tap the **+** at the top to **Add a lab**.

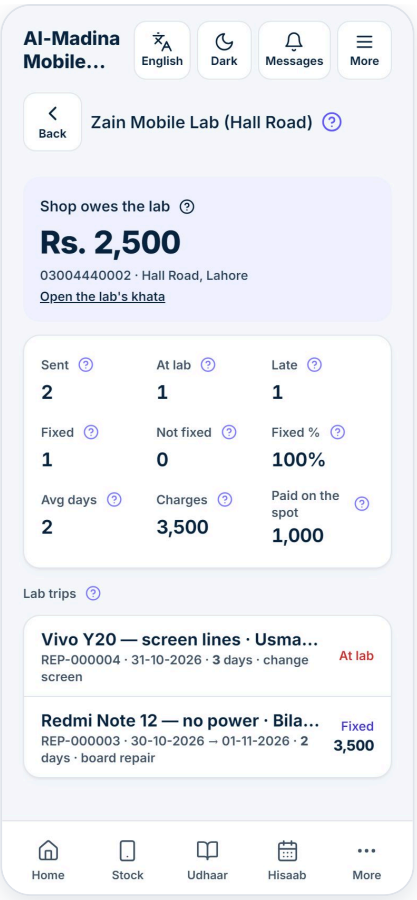

Picture 29: Repair labs: each lab with sent, at lab, fixed % and what the shop owes

Tap a lab to open its record. At the top is **Shop owes the lab** with its phone and address and **Open the lab's khata**. Then nine figures:

Figure	Meaning
Sent	Phones sent to this lab (cancelled trips not counted).
At lab	Phones with this lab right now.
Late	Phones still there after the promised day.
Fixed	Phones it returned fixed.
Not fixed	Phones it returned without fixing.
Fixed %	Fixed out of all returned.
Avg days	How many days it usually keeps a phone.
Charges	Everything it has charged.
Paid on the spot	What you paid when collecting.

Below that, **Lab trips** lists every phone you sent there with the job number, dates, days taken, the work, and the result (**At lab**, **Fixed** with its charge, **Not fixed**).

Picture 30: One lab's record: what the shop owes, nine figures and every lab trip

> **Tip:** Use the record to choose your labs. A lab with a high **Fixed %** and low **Avg days** is worth sending more work to. The owner also sees repairs and labs in **Shop audit** → **Repairs**.

The repair sticker

When a customer's phone comes in, stick a small sticker on it so it is never mixed up with another phone on the bench or at a lab.

1. On the job tap **Print sticker**. The sheet **Repair sticker** opens: *Stick it on the customer's phone. Pick what goes on it.*
2. Under **What goes on it** tap each field to put it on or take it off: **Shop name**, **Job no.**, **Barcode**, **Customer**, **Mobile no.**, **Phone model**, **IMEI**, **Problem**, **Came with**, **Date in**, **Ready by**, **Estimate**, **Advance**, **Left to pay**, **Lab** and **Note**.
3. Choose the **Sticker size** (50×30, 58×40, 60×40, 70×40 mm or an A4 sheet) and the **Copies of each** (1, 2 or 3).
4. Tap **Print**.

Your choice of fields, size and copies is remembered on this phone or computer for next time.

The barcode on the sticker is the job number. Scan it anywhere in the app and the repair job opens straight away, which is handy when a lab returns five phones at once.

Example: the Vivo's sticker reads *AL-MADINA MOBILE ZONE · REP-000004 · Usman Tariq · 03215550003 · Vivo Y20 — screen lines · Screen / display · Ready 02-11 · Left Rs. 5,500*, with the barcode at the bottom.

Picture 31: The printed repair sticker with job number, customer, phone, problem, ready date and barcode

Important: The phone's screen lock (password or pattern) is never printed on the sticker, whatever you choose. A sticker can be seen by anyone, at your counter or at the lab.

Tip: For a lab trip, a short sticker is best: **Job no.**, **Barcode**, **Phone model**, **Problem** and **Lab**. For the counter add **Customer** and **Mobile no.**

Sending the customer a status link

Customers often call to ask whether their phone is ready. Send them a link once, and they can check it themselves.

1. Open the repair job and tap **Send status link to customer**.
2. Tap **Send on WhatsApp**. WhatsApp opens with the customer's number and a ready message; tap send. Or tap **Copy link** and paste it anywhere.

The customer opens the link without logging in and sees the shop's name, the phone and job number, each step (**Received**, **Diagnosed**, **In progress**, **Ready**, **Delivered**) with its date, the ready-by day, the bill, what was paid and what is left, and a **Call the shop** button. The page changes as you move the job forward.

Note: The page never shows the customer's phone number, the full IMEI, the screen lock, the lab's name or your costs. Each link works for one job only, and a link that has been changed does not open.

15. Loans to other shops (amanat)

In the market, shops often give phones to each other "on amanat": the other shop shows it to its customer and either sells it or brings it back. The phone stays **yours** until it is sold or comes back. Mobile Shop tracks every such phone so none is forgotten at someone else's counter.

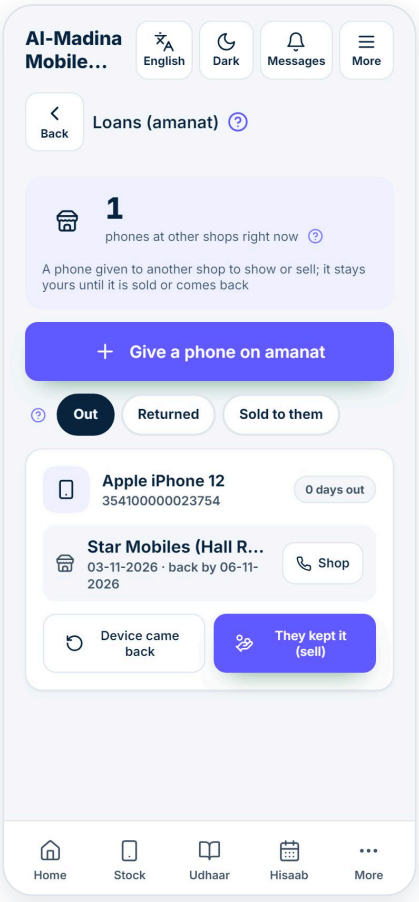

Give a phone on amanat

Example: you give an **Apple iPhone 12** to **Star Mobiles (Hall Road)** for three days.

1. Go to **More → Loans (amanat)**. The top card shows how many **phones at other shops right now**.
2. Tap **Give a phone on amanat**.
3. **Which phone?**: tap the iPhone 12 in the list, or search or scan it.
4. **Which shop?**: search **Star**. A new shop can be added right there with **+**.
5. **Back in**: tap **3 days** (or 7, 15, 30 days, or **No date**).
6. Add **Notes** if you want, and tap **Give on loan**.

The same button, **Give on loan (amanat)**, is on the phone's own page.

The phone now shows **On loan** in the stock list (and is not sold by mistake at your counter), and it appears as a card on the Loans screen with how many days it has been out (**0 days out**), the shop's name, the date given and **back by**, and a **Shop** button to open the shop's page and call them.

Picture 32: Loans (amanat): phones at other shops, with Device came back and They kept it (sell)

When it comes back, or they keep it

The Loans screen has three tabs: **Out**, **Returned** and **Sold to them**. Under each card in **Out**:

- **Device came back**: the app asks *Did this phone come back to you? It goes back into your stock.* Tap **Yes, it is back**. The phone is **In stock** again.
- **They kept it (sell)**: the other shop sold it or wants to keep it. Type the **Agreed price** (for example **150000**) and what they **Paid now** (for example **100000**). The card shows **On their khata 50,000**. Tap **Confirm**. A normal sale bill is made in Sales, and the rest sits on that shop's khata.

A loan past its back-by date shows **Overdue** and is counted on the top card. The **Sold to them** tab keeps an **Open the bill** button for every phone they kept.

> **Tip:** Every loan goes into the phone's history (**Loaned out**, **Loan returned** or **Sold**), so if there is ever an argument about a phone, the date and the shop are on record.

Asking price, price changes and who may go below

Every phone carries an **asking price**: the price you want for it. It is set when you buy the phone, and you can change it on its page with **Change asking price**.

At the sale

The bill shows **Asking: 40,000** next to the price box. Type the real **Sold for** amount: the asking price is only a target.

If the market has moved, tick **Update asking price**, type the new asking price (say 45,000) and a reason. The sale then goes through at the new figure.

Check before you sell

When you tap **Complete sale**, a last screen **Check before you sell** shows every phone on the bill: its cost (owner and manager only), the asking price, the new asking price if you changed it, the sold price and the profit. A red line appears when a phone is going under its asking price. Tap **Confirm and make the bill** to write the bill.

From then on there is one record: the customer's receipt, the phone's history, the reports and the khata all show the same sold price.

Nothing is overwritten

The phone's history keeps the first asking price (40,000), a line **Price changed 40,000 → 45,000 · at the sale · market rate** with the seller's name and the time, and the sale at 45,000. On the phone's money card you see **Asking now** and, when it is different, **First asking**.

Price rules: who may go below the asking price

The owner decides this in **More → Settings → Price rules**. There are two settings:

- **Selling under the asking price**
- **Changing the asking price**

Each one can be set to:

Choice	What it means
Anyone	Every staff member may do it.
Owner / manager	Staff see a message that it needs the owner or manager, and cannot go on.
With owner PIN	A PIN box appears on the check screen. The owner types his quick PIN on the spot, the sale goes through, and the approval is written on the record.

The owner and manager may always do both. The owner sets his PIN under **More → Staff**. Five wrong PINs lock the box for ten minutes. The same rule covers selling an item under its minimum sale price (chapter 13).

Example: your salesman Kashif wants to sell a Rs. 40,000 phone for Rs. 38,500. The rule is **With owner PIN**. On the check screen a red line shows the phone going Rs. 1,500 under asking. You type your PIN on his phone, the bill is made, and the record shows "approved by owner".

The Prices report

Reports → Prices (owner and manager) lists every asking-price change and every sale under the asking price in the chosen period: the phone and IMEI, who did it, old and new price or asking against sold, the difference, the profit, the reason, the bill number, and who approved by PIN. A count per person is shown on top, so you can see at a glance who gives the most discounts.

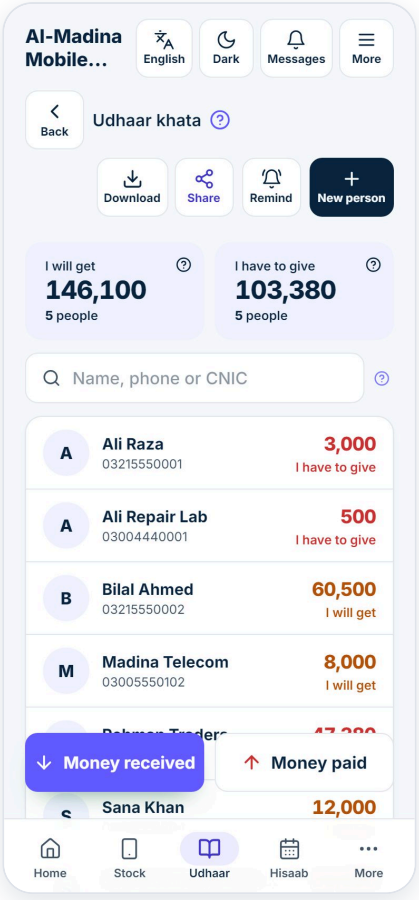

> **Important:** A finished bill's amounts cannot be edited by anyone, not even the owner. A mistake is corrected with a return (chapter 9) and a new bill, so the record always stays true.

16. Udhaar khata and payments

Every shop gives some things on credit and takes some things on credit. In the app this is called **udhaar** (credit), and every person has one **khata** (their account page). The app keeps each khata for you: every sale, purchase, payment, return and len-den with that person lands in it by itself, and the balance is always worked out from those records. You never type a balance by hand.

Open the Udhaar khata

Tap **Udhaar** in the bottom bar (or Home → **Udhaar**, or More → **Udhaar**).

Picture 33: The Udhaar khata: who owes you and whom you owe

At the top you see two big boxes:

- **I will get** is the total that people owe you, and how many people. Tap it to show only them.
- **I have to give** is the total you owe others (dealers, other shops, repair labs), and to how many people.

Below them is the list of people. Each name shows the amount and, in colour, **I will get** or **I have to give**. A person whose account is settled shows **Clear**.

The buttons at the top:

- **Download** gives the whole khata as PDF, Excel or CSV. **Share** sends it straight to WhatsApp or another app.
- **Remind** opens the WhatsApp reminder list (see below).
- **New person** adds a customer, dealer, other shop or technician.

Use the search box (**Name, phone or CNIC**) to find anyone quickly. Even a few digits of the phone number are enough.

> **Tip:** The two buttons at the bottom of the khata, **Money received** and **Money paid**, are the fastest way to record a payment without opening the person's page first.

Add a new person

1. Tap **New person**.
2. Write the **Name** and, if they have one, the **Mobile number** (after +92, without the first 0, for example `3001234567`). The number is optional; without it there are no WhatsApp messages or reminders to that person. It can be added later with **Edit**.
3. Pick the **Type**: **Customer**, **Dealer**, **Other shop** or **Technician**.
4. If you want more, tap **More details**: **CNIC** (and the CNIC scan), **City**, **Address**, **Notes** and, for a dealer, the wholesale price. It opens by itself when you edit someone who already has these.
5. If this person already owed you (or you owed them) in your old register, write it in **Opening balance** and choose **Party owes me** or **I owe party**.
6. Tap **Save**.

> **Note:** People are also created by themselves when you sell to a new customer or buy from a new seller. You only need **New person** when you want to add someone before any dealing.

Money received (a customer pays you)

Example: Bilal Ahmed owes you Rs. 60,500 for a phone. Today he brings Rs. 10,000.

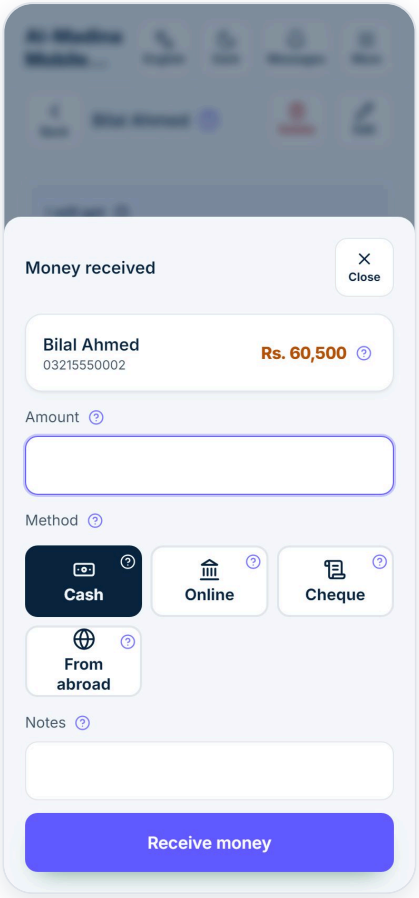

1. Tap **Money received** (on the khata, or on Bilal's own page).
2. Pick **Bilal Ahmed** if he is not already chosen. His balance shows beside his name.
3. In **Amount** write `10000`.
4. Pick the **Method** (see the list below). Here it is **Cash**.
5. Add **Notes** if you like (for example "first part").
6. Tap **Receive money**.

The four methods:

- **Cash**: he paid at the counter. The money goes into your galla (cash drawer).
- **Online**: he sent it by bank transfer, Easypaisa, JazzCash or another app. Pick which of your accounts received it; the galla does not change.
- **Cheque**: he gave a cheque. Cheques are kept in their own account until they clear.

- **From abroad**: a relative sent it through a remittance service. Write the amount in their currency and the rate (for example 500 SAR × 74.20); the app works out the rupees.

Bilal's balance goes down to Rs. 50,500 at once. The payment is put against his oldest unpaid bills first, so his bills show **Paid** or **Part paid** correctly. A receipt is ready to print or send on WhatsApp.

Picture 34: Money received: amount and method

> **Tip:** If a person pays more than he owes, the extra is kept as an advance in his khata. It is used against his next bill.

Money paid (you pay a dealer or seller)

Example: you bought five phones from Rehman Traders and still owe them Rs. 47,280. Today you pay Rs. 20,000 from your HBL account.

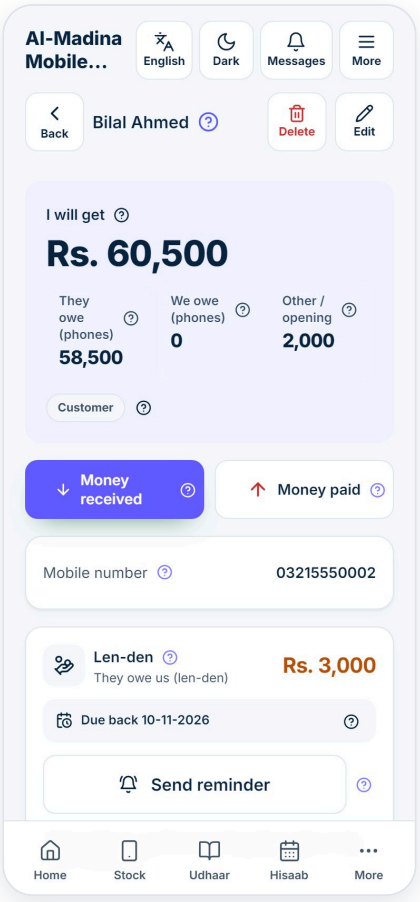

1. Tap **Money paid**.
2. Pick **Rehman Traders**.
3. **Amount** `20000`, **Method Online**, account **HBL Current**.
4. Tap **Pay money**.

What you owe Rehman Traders drops to Rs. 27,280 and the HBL balance in **Cash & bank** drops by Rs. 20,000.

> **Important: Money received** and **Money paid** are for bills. If you give or take money with no bill at all (a loan to a friend, money borrowed from a neighbour shop), use **Len-den** instead. See chapter 17.

A person's page

Tap any name in the khata to open their page.

Picture 35: One person's khata page

At the top is the big balance card: **I will get**, **I have to give** or **Clear**. Under it the balance is split into three parts so you understand where it comes from:

- **They owe (phones)** is what is still unpaid on their sale bills.
- **We owe (phones)** is what you still owe on your purchase bills from them.
- **Other / opening** is everything else: the opening balance from your old diary, accessories, len-den and adjustments.

Below that you will find:

- **Money received** and **Money paid** buttons for this person.
- Their **Mobile number**, with call and WhatsApp.
- The **Len-den** card (chapter 17).
- The phones you sold to them and bought from them.

- **Khata history**: every sale, payment, return and len-den with the date, the amount and the running balance after each line.
- **Edit** to change their name, phone or type, **Delete** to remove a person entered by mistake, and **Download** for their statement as PDF, Excel or CSV.

> **Tip:** When a customer argues about his balance, open his page, tap **Download** → **PDF** and send him the statement on WhatsApp. Every line has a date and a bill number.

Open balances: to get / to give by phone, customer, dealer, technician

Owner and manager only. On the **Udhaar** screen tap **Get / give** at the top (or **More** → **Open balances**).

- The two cards at the top are the shop's totals: **To get (receivable)** and **To give (payable)**. Tap one to see only that side.
- Switch between **Mobile / IMEI**, **Customer**, **Dealer** and **Technician**. It is the same money grouped four ways; each amount is counted once.
- Search by IMEI, phone model, name or bill number.
- Each row shows **Get** and **Give** separately, even when the same phone or person has both. Example: one phone bought from Bilal on udhaar (20,000), sold to Ali on udhaar (15,000) and repaired at Usman's lab (2,000 not paid) shows **Get 15,000** and **Give 22,000**.
- A bill with more than one phone keeps what is left on the bill. In the phone view it shows once under **Unallocated by IMEI**, and it still shows under the person.
- Something no bill explains, like an old balance or an advance, shows under the person as **Old balance / other**.

Tap a row to see each bill, job or lab charge behind it: the person, the total, what was paid (with the payments) and what is left. **Open** shows the bill. **Receive payment** or **Make payment** opens the usual payment form with the person, the direction, the amount and the bill already filled in; the line **This settles** says what the money is for. You can pay all or part. The payment receipt prints as usual, and every list updates.

Fixing a mistake

The khata is like a bound register: pages are never torn out. If a payment was entered wrongly, open it and cancel it with a reason. The old entry stays (crossed out) and a reversing entry fixes the balance. Then enter the correct one. This way the history always shows what happened and who did it.

Udhaar reminders on WhatsApp

Tap **Remind** at the top of the Udhaar khata. Everyone who owes you is listed, biggest balance first, with how many days their account has sat and when they were last reminded. Narrow the list with **Older than 7 / 15 / 30 days**.

1. Tap the green WhatsApp button beside a name.
2. WhatsApp opens with the message already written in the shop's language, for example: "Bilal, a reminder from Al-Madina Mobile: Rs. 50,500 is outstanding on your account."
3. Press send in WhatsApp.

Send to all goes through the list one by one so you can send each message quickly.

Automatic reminders: go to More → **Notifications** → **Udhaar reminders**, tick **Remind customers automatically**, and choose after how many quiet days (**When the account has sat for**) and at what time. Each night the app reminds the people whose accounts have sat that long. Automatic sending needs the WhatsApp Business service set up by your software provider; without it, the messages wait in **Messages** (the bell at the top) and open in WhatsApp with one tap.

> **Note:** Reminders are polite and never go to someone you owe money to. Installment and len-den reminders follow the same switch.

The night report

The owner can get the whole day's hisaab every night on WhatsApp or by email, even when he is not at the shop.

1. Go to More → **Notifications**.
2. Under **To owner**, write the **Owner WhatsApp number** and/or the **Owner email**.
3. Under **Night report to the owner**, tick **Send the day's hisaab every night · WhatsApp** and/or · **Email**.
4. Set the time (**At**), for example 21:30.

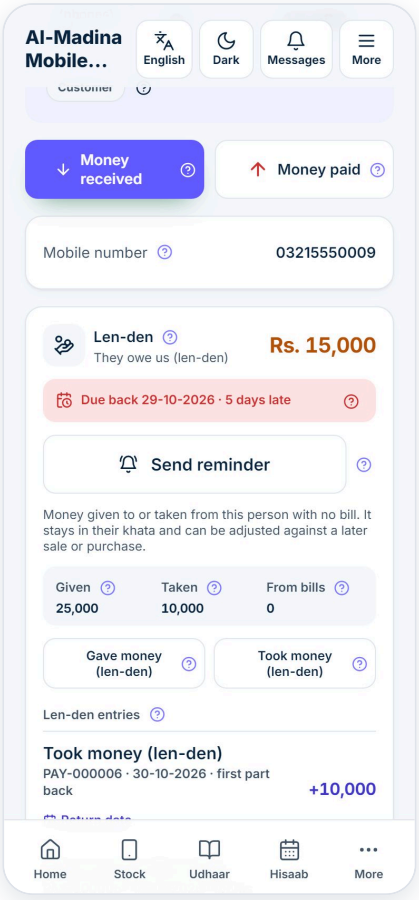

Every night one message arrives with: phones sold and the amount, money in hand, udhaar given and received, expenses, profit, total to get and to give, and phones in stock. **Send today's hisaab now** sends it immediately, which is handy to test.

> **Tip:** On the same screen you can also ask for a message **On every sale** or **On stock added**, by WhatsApp or email. Good for an owner who runs two shops.

17. Len-den (money given or taken with no bill)

In every market, money moves between people without any sale or purchase. You lend Rs. 25,000 to a regular customer for a family need. A neighbour shop lends you Rs. 50,000 for a day to pay a dealer. In shop language this is **len-den** (give and take). It is not a sale and not a purchase, so it should not spoil your sales or udhaar figures.

The app keeps len-den in the same khata as the person's bills, so a person always has one total. But it is marked as len-den everywhere, so every report shows it apart, and later you can adjust it against a bill if that person buys from you or sells to you.

Picture 36: The Len-den card on a person's page

Record money you gave (len-den out)

Example: Usman, a regular customer, asks for Rs. 25,000 and promises to return it by the 29th.

1. Open Usman's page from the Udhaar khata (add him with **New person** if he is new).
2. Scroll to the **Len-den** card and tap **Gave money (len-den)**.
3. Write the **Len-den amount**: `25000`.
4. Pick how the money left: **Cash** from the galla, or **Online** from a bank or wallet.
5. Set the **Return date (optional)**, for example 29-10-2026.
6. Add a note if you like ("for his sister's wedding").

7. Tap **Save — money given**.

Usman's card now shows **They owe us (len-den)** Rs. 25,000 and **Due back 29-10-2026**. A small receipt titled "Len-den" can be printed or sent to him.

Record money you took (len-den in)

Example: Madina Telecom next door lends you Rs. 50,000 in cash.

1. Open Madina Telecom's page.
2. Tap **Took money (len-den)**.
3. Amount `50000`, method **Cash**, return date if agreed.
4. Tap **Save — money taken**.

The card shows **We owe them (len-den)** Rs. 50,000. The money is now in your galla, and the day's hisaab shows it as **Len-den taken**, not as a sale.

What the Len-den card shows

- The open len-den in big figures, with **They owe us (len-den)**, **We owe them (len-den)** or **No len-den open**.
- The return date: **Due back** with the date, **Due back today**, or in red **5 days late**. For money the shop owes, it says **We give back by** the date.
- **Given**: all len-den money the shop has given this person.
- **Taken**: all len-den money taken from this person, including money he paid back.
- **From bills**: the rest of the khata balance that comes from bills, not from len-den.
- **Len-den entries**: each entry with its number, date and note. Given shows with minus, taken with plus. Cancelled ones are struck through.

Worked example: you lent Usman Rs. 25,000. On 30-10 he returned Rs. 10,000. The card shows **Given** 25,000, **Taken** 10,000, and **They owe us (len-den)** Rs. 15,000.

When the person pays back

Money coming back from a len-den is also len-den. Open the person's page and tap **Took money (len-den)** with the amount he returned. Do not use **Money received** for this, because that is for bills.

Likewise, when you return borrowed money to Madina Telecom, use **Gave money (len-den)**.

Return dates and reminders

1. Set the date when you record the entry, or later: in **Len-den entries**, tap the date line under an entry, choose the new **Return date** and tap **Save date**.
2. When the date is near or passed, the card turns red with the number of days late.
3. Tap **Send reminder**. WhatsApp opens with a polite message showing the amount and the date. Press send. The card then shows **Last reminded** with the date.

If automatic reminders are on (More → **Notifications** → **Udhaar reminders**), the app also reminds people whose len-den is due tomorrow or late, at most once every three days.

> **Note:** Reminders only go to people who owe the shop. When the shop owes someone, no message goes to them; instead the owner sees "len-den the shop must give back soon" on the Home screen, so he can arrange the money.

The Home screen's **Needs attention** also shows "people late returning len-den".

Adjust len-den against a bill

Sometimes the same person later buys a phone from you, or sells you one. The money already given can then pay that bill.

Example: Kamran left Rs. 10,000 with you as len-den (you recorded **Took money (len-den)**). Next week he buys a handsfree, charger and cover for Rs. 8,000 on udhaar. On his page the app now shows a card **Adjust against bills**: "Rs. 8,000 of the money they gave can pay their open sale bills".

1. Open the person's page.
2. Find the **Adjust against bills** card.
3. Tap **Adjust now**.

The bill becomes **Paid**, and Rs. 2,000 stays open as len-den. The khata total does not change at all; only the bills now show as paid. No money moves in the galla.

The same works the other way round: money the shop gave can pay the shop's open purchase bills to that person. Old advances are used first, then len-den, oldest first.

> **Tip:** Adjusting is never automatic. The app asks you, because only you know whether Kamran meant the money for his bill or wants it back.

Cancelling a wrong len-den entry

Open the entry and cancel it with a reason, like any payment. It stays in the list, struck through, and the balance is corrected by a reversing entry.

Where len-den shows in reports

- **Day's hisaab**: **Len-den given** under Went out and **Len-den taken** under Came in.
- **Shop audit** → **Udhaar**: the line **Of which len-den** tells you how much of the total udhaar is len-den. It is inside the total, not extra.
- **Shop audit** → **Len-den**: a full screen of its own (see chapter 21).
- **Udhaar received** in reports counts only bill money, never len-den.

18. Installments (qist)

Many customers buy a phone on installments: some money now (advance), the rest in equal monthly parts called **qist**. A guarantor (**zamin**) signs for the customer. The app sets up the plan, reminds you who is due, and keeps everything in the customer's khata.

> **Note:** Installments is a module. If you do not see it, ask your software provider to switch on **Installments (qist)** for your shop.

Sell a phone on installments

Example: Waqas Ali buys a Samsung Galaxy A35 for Rs. 85,000. He pays Rs. 25,000 now and the rest in 6 monthly installments.

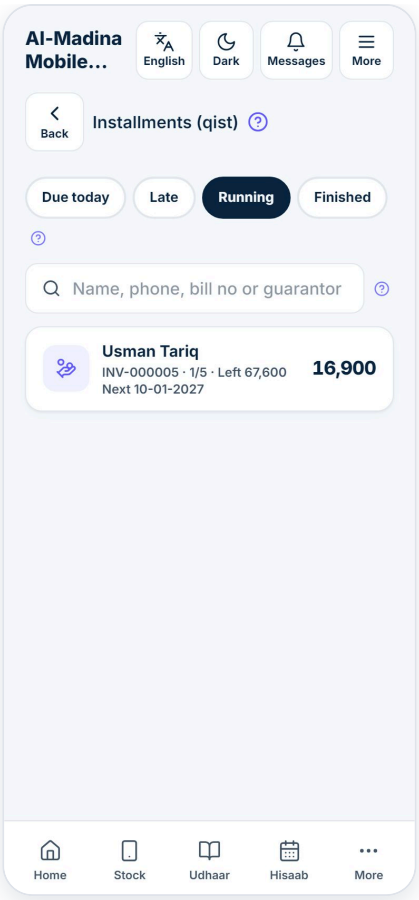

1. Tap **Sell** and pick the phone.
2. Set the price: Rs. 85,000.
3. Tick **Sell on installments (qist)**.
4. Choose the customer, **Waqas Ali** (or add him).
5. Write the **Advance paid now (Rs)**: `25000`. It is taken by the payment method you chose on the sale (cash, online or cheque).
6. Under **How many months**, tap **3**, **6**, **9**, **12**, **18** or **24**. Here tap **6**.
7. The **Monthly (Rs)** amount fills itself: (85,000 − 25,000) ÷ 6 = Rs. 10,000. Change it if you agreed a different figure; the last installment takes whatever is left.
8. Set the **Day of month** the installment is due (for example the 10th). Leave **First installment on** empty to start next month on that day, or pick a date.
9. Under **Guarantor (zamin)**, write the guarantor's name, mobile and CNIC.
10. Complete the sale.

The receipt prints the plan: "Advance Rs. 25,000 · 6 × Rs. 10,000 · day 10 of each month", the first date and the guarantor. The rest (Rs. 60,000) sits on Waqas's khata as normal udhaar.

> **Note:** If the months and the monthly amount together do not cover what is left, the app asks you to check them before it lets you finish.

The installments list

Go to More → **Installments (qist)**.

Picture 37: Installments (qist): plans by status

Four tabs show the plans:

- **Due today**: installments that fall due today.
- **Late**: plans with a missed installment.
- **Running**: all plans still being paid.
- **Finished**: plans fully paid.

Search by **Name, phone, bill no or guarantor**. Each plan in the list shows the customer, the bill number, how many installments are paid (for example 1/5), the amount left and the next date.

Tap a plan to see the schedule. Each installment is marked **Paid**, **Part**, **Today**, **Late** or **Due**. The customer's and guarantor's numbers are there with Call and WhatsApp.

Take an installment

1. Open the plan and tap **Take installment**.
2. The next installment's amount is filled in. Change it if he pays only part, or pays two months together.
3. Pick cash, online or cheque.
4. Save.

It is a normal payment on that bill, so the khata, the day's hisaab and the customer's statement all agree.

Reminders

- Tap **Remind on WhatsApp** on a plan. WhatsApp opens with "your installment of Rs. 10,000 is due on 10-01-2027" (or "is late by 5 days").
- When **Remind customers automatically** is on, plans whose installment is due tomorrow or late are reminded by themselves at night, at most once in three days.
- Home's **Needs attention** shows **installments due today** and **installment plans running late**.

> **Tip:** Check the **Late** tab every morning. Calling the guarantor early, politely, saves many disputes later.

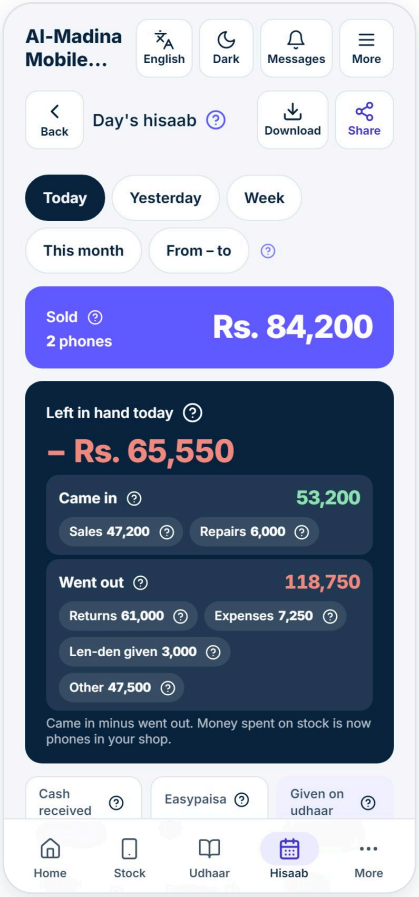

19. Day's hisaab, expenses and money accounts

At the end of the day every shopkeeper asks three questions: how much did I sell, how much money is in my hand, and where did the rest go? The **Day's hisaab** answers all three on one screen.

Open the Day's hisaab

Tap **Hisaab** in the bottom bar (or Home → the hisaab card → **See details**, or More → **Day's hisaab**).

Pick the period at the top: **Today**, **Yesterday**, **Week**, **This month** or **From – to**. For **From – to** choose two dates; "from" cannot be after "to", and neither can be in the future.

Picture 38: The Day's hisaab

What you see, from top to bottom:

- **Sold**: how many phones were sold and the total amount. Sales that were returned are not counted.
- **Left in hand today**: the big dark card. It is **Came in** minus **Went out**.
- **Came in**, with the reasons as small chips: **Sales**, **Udhaar received**, **Repairs**, **Len-den taken**, **Moved in from own account**, **Other**.
- **Went out**, with the reasons: **Stock bought**, **Returns**, **Expenses**, **Paid to people**, **Len-den given**, **Moved to own account**, **Other**.

- Boxes for **Cash received**, **Easypaisa** (and your other wallets), **Given on udhaar**, **Udhaar received**, **Expense**, **Given back on returns**, **Cut on returns** and **Profit** (owner and manager only).
- **What was sold**: each sale with how it was paid (**Cash**, **Udhaar**, **Part udhaar** and so on) and which staff member sold it.

Tap a chip or a box to see the entries behind it. **Download** gives the hisaab as PDF, Excel or CSV, and **Share** sends it on WhatsApp.

What "Left in hand" means, with a worked example

"Left in hand" is real money: everything that came into your galla, bank and wallets, minus everything that went out, in the chosen period. It is not profit. Money you spent on stock is not lost; it is now phones on your shelf.

Example day at Al-Madina Mobile:

What happened today	Came in	Went out
Sold a Vivo Y21 for cash	Rs. 38,000	
Sold an Oppo A17 for cash	Rs. 45,000	
Bilal paid part of his udhaar	Rs. 10,000	
Repair delivered (screen change)	Rs. 6,000	
Bought a used iPhone 11 from a customer		Rs. 72,000
Paid electricity bill and tea		Rs. 3,050
Lent Usman (len-den)		Rs. 3,000
Total	**Rs. 99,000**	**Rs. 78,050**

Left in hand = Rs. 99,000 − Rs. 78,050 = **Rs. 20,950**.

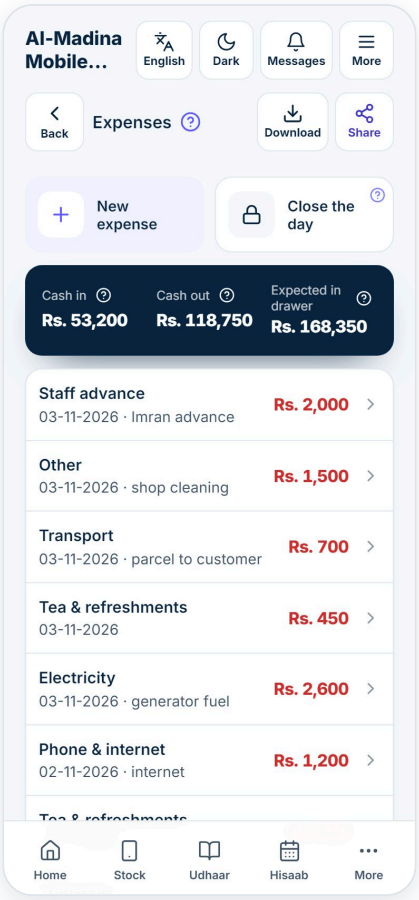

Now suppose the same day you had also bought five phones from a dealer for Rs. 150,000 cash. Then Went out would be Rs. 228,050 and Left in hand would show **– Rs. 129,050**. Do not panic. The minus does not mean you lost money; Rs. 150,000 is now standing in your shop as five phones. Your profit is shown separately in **Profit** and in Reports.

> **Tip:** A minus "Left in hand" is normal on days you buy stock or a customer returns a phone. Look at the reason chips under **Went out** to see why.

> **Note:** Moving money between your own accounts (galla to bank, for example) shows as **Moved in from own account** and **Moved to own account**. It is neither income nor expense.

Add an expense

Owner and manager. Home → **Expense**, or More → **Expenses**.

Picture 39: Expenses list with Close the day

The top of the screen shows today's **Cash in**, **Cash out** and **Expected in drawer**, so you always know what the galla should hold.

Example: you paid Rs. 2,600 for generator fuel.

1. Tap **New expense**.
2. Pick the **Category**: **Electricity**. Other ready categories include **Shop rent**, **Salary**, **Staff advance**, **Tea & refreshments**, **Repair parts**, **Transport**, **Phone & internet**, **Taxes & fees**, **Owner drawing** and **Other**.
3. **Amount**: `2600`.
4. **Details** (optional): "generator fuel".
5. Tap **Save**.

The expense is taken from the galla and shows in the list with its date and details. It also appears in the day's hisaab under **Expenses** and in the profit report.

To add your own category (for example "Committee" or "Generator"), open the category list and add a name. You can also rename or remove your own categories.

To fix an expense, tap it and choose **Edit**, or cancel it with a reason. A cancelled expense stays in the list, crossed out, so nothing disappears without a trace.

> **Important:** Money the owner takes home for himself is **Owner drawing**, not a shop expense. The profit report keeps it apart as "Owner took out (not an expense)", so your real profit is not spoiled.

Close the day

At night, count the galla and close the day. This catches mistakes while everyone still remembers the day.

1. On **Expenses**, tap **Close the day**.
2. You see **Opening cash**, **Cash in**, **Cash out** and **Expected in drawer**.
3. Count the cash in the drawer and type it in **Counted cash**, for example `168000`.
4. **Difference** shows any shortage or extra. If Expected was Rs. 168,350, the difference is − Rs. 350.
5. Tap **Close the day**.

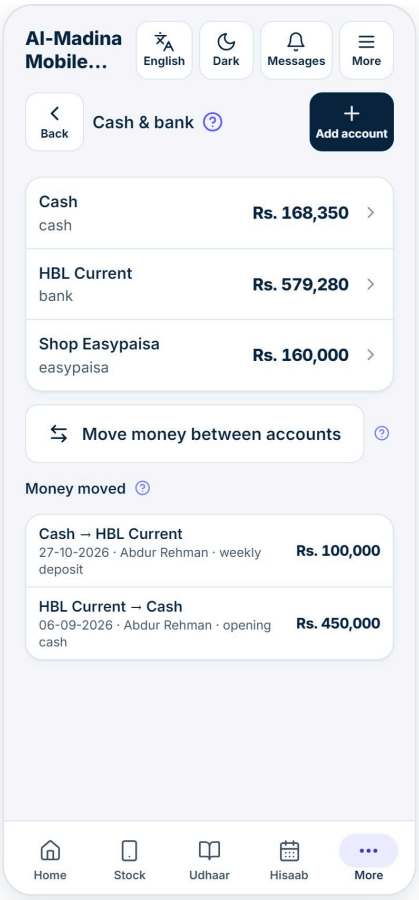

Once a day is closed it says **Already closed**.

> **Tip:** A small difference every day usually means change given from the galla without an entry, or a tea expense not written. Make it a rule that every rupee leaving the galla is entered.

Money accounts: galla, bank, Easypaisa, JazzCash

Most shops keep money in more than one place: the galla (cash drawer), a bank account, and one or two wallets like Easypaisa and JazzCash. The app keeps a separate balance for each.

Go to More → **Cash & bank**.

Picture 40: Cash & bank: each account with its balance

Each account shows its name, its type and its balance. Tap an account to open its **Cash book**: every rupee in and out with the date and reason.

Add an account:

1. Tap **Add account**.
2. Write the **Account name**, for example "Shop Easypaisa" or "HBL Current".
3. Pick the **Type** (cash, bank, Easypaisa, JazzCash and so on).
4. Write the **Account / wallet no.** if you like.
5. Write the **Opening balance**: what is in that account today.
6. Save.

The new account now appears as a choice whenever you pick **Online** for a sale, purchase or payment.

Move money between accounts. Example: every Saturday you deposit Rs. 100,000 from the galla into HBL.

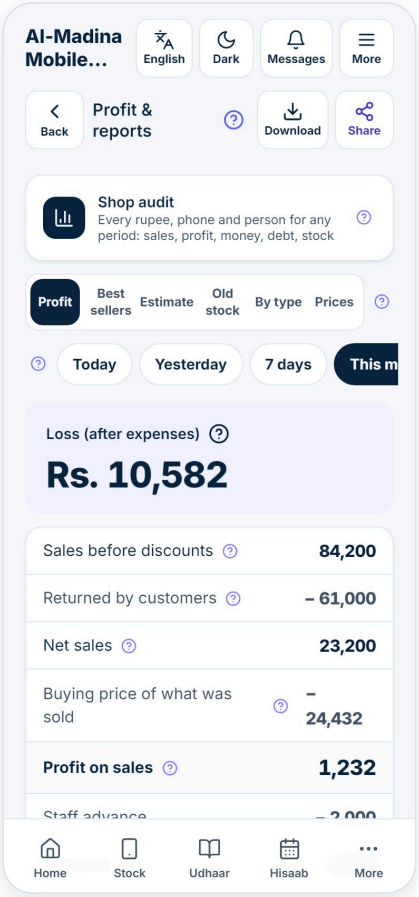

1. Tap **Move money between accounts**.
2. **From**: Cash. **To**: HBL Current.
3. **Amount**: `100000`. **Note**: "weekly deposit".
4. Tap **Move**.

Only the two balances change. It is neither a sale nor an expense. The move is listed under **Money moved** with the date and who did it.

> **Tip:** When a customer pays by Easypaisa, always choose **Online** and then your Easypaisa account. Your galla count at night will then match, because that money never entered the drawer.

20. Reports and downloads

Owner and manager: Home → **Profit & reports**, or More → **Reports**.

Picture 41: Profit & reports

At the top is a card that opens the **Shop audit** (chapter 21), the deepest report in the app. Below it are the quick report tabs:

- **Profit**: the profit for the period.
- **Best sellers**: which models sell most.
- **Estimate**: a guess for the next 7 days and which phones will run out.
- **Old stock**: phones by how many days they have been in the shop.
- **By type**: stock by type (phones, tablets, watches) with units, value at cost and at asking price.
- **Prices**: every asking-price change and every sale under the asking price, with who did it.

Choose the period with the chips: **Today**, **Yesterday**, **7 days**, **This month** or **From – to**.

The Profit report

The Profit tab reads like a simple account statement, line by line:

- **Sales before discounts**
- **Discounts given**

- **Returned by customers** (minus)
- **Net sales**
- **Buying price of what was sold** (minus)
- **Profit on sales**
- **Repair & other income** (repairs, cuts kept on returns)
- Each expense category (minus)
- **Real profit (after expenses)**, or **Loss (after expenses)** if expenses were bigger.

Below it you also see **Tax collected** and **Owner took out (not an expense)**.

Worked example (one week): Net sales Rs. 420,000. Buying price of what was sold Rs. 371,500. Profit on sales Rs. 48,500. Repair income Rs. 12,000. Expenses Rs. 18,200 (rent share, electricity, tea, transport). Real profit = 48,500 + 12,000 − 18,200 = **Rs. 42,300**.

> **Note:** Profit is counted when a phone is sold, not when the money is received. A phone sold on udhaar shows its profit today, and the money comes into "Left in hand" later, when the customer pays.

Best sellers and Estimate

Best sellers lists models by how many were sold and how much they brought in. Look at it before you go to the market to buy.

Estimate looks at your last four weeks and shows **Next 7 days (estimate)** and **Which phone will run out**, with the advice **Buy more**, **OK** or **Not selling**. It is a guess based on your own sales, not a promise.

Old stock and Prices

Old stock groups the phones still in the shop by days in stock. A phone sitting for 60 days is money stuck on a shelf; think about a lower price or an exchange deal.

Prices shows each asking-price change and each sale made under the asking price, who did it and when. It is a quiet check on the discounts your staff give.

Downloading and sharing (PDF, Excel, CSV)

Almost every list in the app can be downloaded or shared.

1. Tap **Download** or **Share** at the top right of the report.
2. Choose the format (see the list below).
3. Download saves the file (website: your Downloads folder; Android app: Documents › MobileShop). Share opens your phone's share list, so you can send it on WhatsApp straight away.

The formats:

- **PDF**: a ready file to send or keep. Urdu reports stay in proper Nastaliq.

- **Excel**: for Excel or Google Sheets.
- **CSV**: a simple file that any software can open.
- **Print** (Download only): print on paper.

Download and **Share** buttons are also on Day's hisaab, Stock in shop, Udhaar khata, a person's page, Stock list, Expenses, Sales list and Purchases list.

> **Tip:** At month end, download the Profit report for **This month** as PDF and keep it in a WhatsApp chat with yourself. In a year you will have twelve monthly statements without any effort.

> **Note:** A computer that cannot share files downloads the file instead and tells you so.

Balance sheet and trial balance

The **Balance** tab shows your shop's books the way an accountant reads them. Both pages are worked out from every entry, so nothing on them is typed by hand and nothing can be changed there.

1. Open **More** → **Reports** and tap the **Balance** tab.
2. Under **As of**, keep today or pick an older day, for example 30 June for the yearly books.
3. **Balance sheet** shows three boxes: **What the shop has** (galla, bank and wallets, **People who owe you**, **Stock at cost**), **What the shop owes** (**You owe people**, **Tax collected, still to pay**) and **Owner's share** (the owner's money put in, **Profit so far**, minus **Owner took**).
4. Tap **Trial balance** to see every account with its debit or credit balance and the two totals.
5. The green line **Balanced** confirms that what the shop has equals what it owes plus the owner's share.

Example: has Rs. 9,50,000 = owes Rs. 1,50,000 + owner's share Rs. 8,00,000.

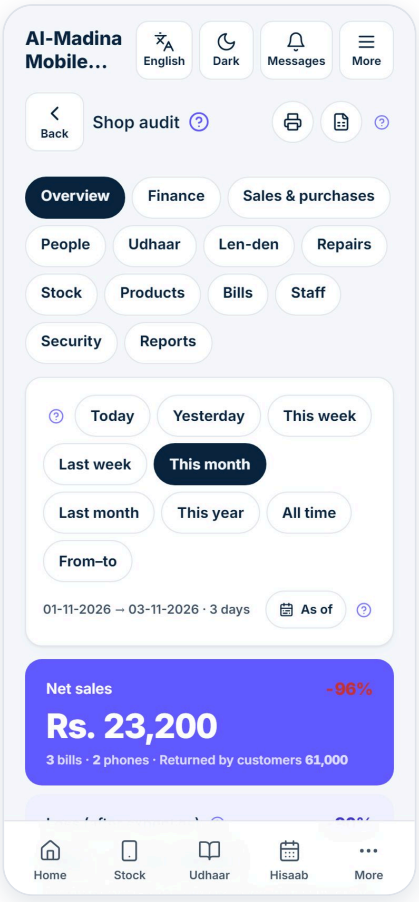

> **Tip: Profit so far** is the same figure as the **Profit** tab from your first day to that date. Tap **People who owe you** to open the udhaar khata.

> **Note:** Only the owner and the manager see this tab.

21. Shop audit

The **Shop audit** is the full check-up of your business. It answers questions like: "How much did I really earn last month?", "Where did the money go?", "Who owes me, and since when?" and "Which phones are stuck on my shelf?". Every figure is worked out from the shop's own records, and every figure can be tapped to see the exact bills, payments or phones behind it.

Where: More → **Shop audit**, or the **Shop audit** card at the top of Profit & reports. Owner and manager only. (The **Security** tab is for the owner alone.)

Picture 42: Shop audit: the tabs and the period bar

The tabs and the period bar

Along the top are the tabs: **Overview**, **Finance**, **Sales & purchases**, **People**, **Udhaar**, **Len-den**, **Repairs**, **Stock**, **Products**, **Bills**, **Staff**, **Security** and **Reports**.

Under them is the period bar, the same on every tab:

- **Today**, **Yesterday**, **This week**, **Last week**, **This month**, **Last month**, **This year**, **All time**, or **From–to** for any two dates.
- The line under the chips shows the exact dates and how many days, for example "01-11-2026 → 03-11-2026 · 3 days".

- **As of** lets you pick a past day for balances. Pick 30 September and every balance (cash and bank, who owes whom, phones in stock) is rebuilt exactly as it stood that evening.

The two round buttons at the top right are **Print** and **Excel**: they give the screen you are looking at as a printable page or an Excel file.

Most figures also show the change against the period before, for example "+12%" in green or "−8%" in red.

Drill down: every figure opens its rows

This is the most important habit in the audit. When a number looks strange, tap it.

Example: the Overview says "Expenses Rs. 38,400" for this month, and you feel it is too high. Tap it. The list of every expense opens, biggest first, with date, category, amount and who entered it. You find a Rs. 9,000 "Repair parts" entry that should have been charged to a customer's repair. Now you know exactly what to fix.

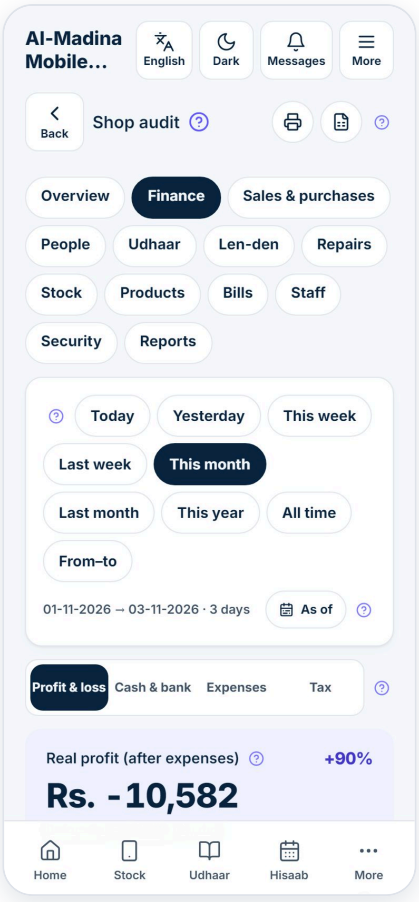

The same works for sales, money in and out, people's balances, phones in stock and everything else. Nothing in the audit is a number you cannot check.

Overview

The Overview is one page for the whole period:

- **Net sales** with the number of bills and phones, and what customers returned.
- **Real profit (after expenses)**, or loss.
- Stock bought, expenses, money in and money out for the period.
- Cash and bank, phones in stock, people who owe us and people we owe, each shown as **Start → End → Now**.
- **Needs a look**: things to deal with today, such as ID checks not cleared, stock alerts, late installments and len-den return dates. Tap a chip to open the list.
- **Checks**: the books proving themselves. For example: cash at start + money in − money out = cash at end; every entry balanced; the khata matches the ledger; stock at start + in − out = stock at end. A green tick means the figures agree.

Finance: profit and cash

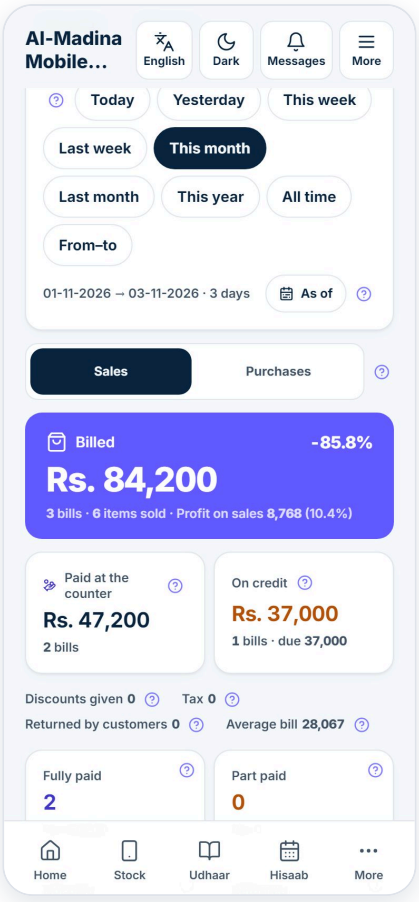

Picture 43: Finance: profit and loss, cash and bank, expenses, tax

Finance has four parts:

- **Profit & loss**: sales before discounts, discounts, returns, net sales, cost of what was sold, gross profit, expenses, profit after expenses, other income and **Real profit (after expenses)**. Each line has the period before in brackets, and a chart shows profit by day, week or month.
- **Cash & bank**: where money came from and where it went, for the galla, each bank and each wallet, from start to end of the period. Money moved between your own accounts is shown apart. Money from abroad shows the sender, the currency, the rate and the reference.
- **Expenses**: by category with the period before, the largest entries and who entered them.
- **Tax**: every bill on which tax was charged.

Worked example: last month Net sales Rs. 1,250,000, cost of goods Rs. 1,105,000, gross profit Rs. 145,000, expenses Rs. 61,000, repair income Rs. 22,000. Real profit = 145,000 − 61,000 + 22,000 = **Rs. 106,000**.

Sales & purchases

Picture 44: Sales & purchases: billed, paid at the counter, on credit

Two halves, **Sales** and **Purchases**.

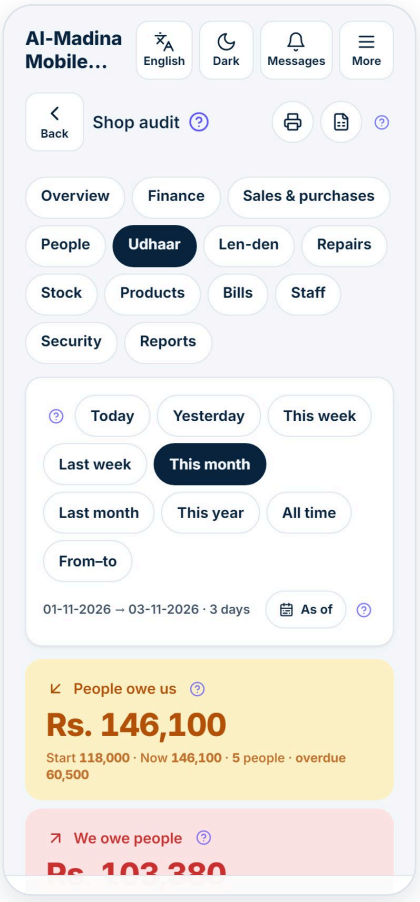

On **Sales**: the total **Billed** with bills, items sold and **Profit on sales**; then **Paid at the counter** against **On credit** (with how much is still due); **Discounts given**, **Tax**, **Returned by customers** and **Average bill**; and how many bills are **Fully paid**, **Part paid** or not paid. Below that, sales by employee and by customer.

On **Purchases**: what was bought, what was paid and what is still owed, per supplier and per employee.

People

Top customers and suppliers by the measure you pick: sales, number of bills, profit, purchases, phones, or the biggest amounts owed either way. Tap a person to open their **Whole journey**: first and last dealing, phones sold to them and bought from them, money received and paid, returns and the balance, also as of any past day.

Udhaar

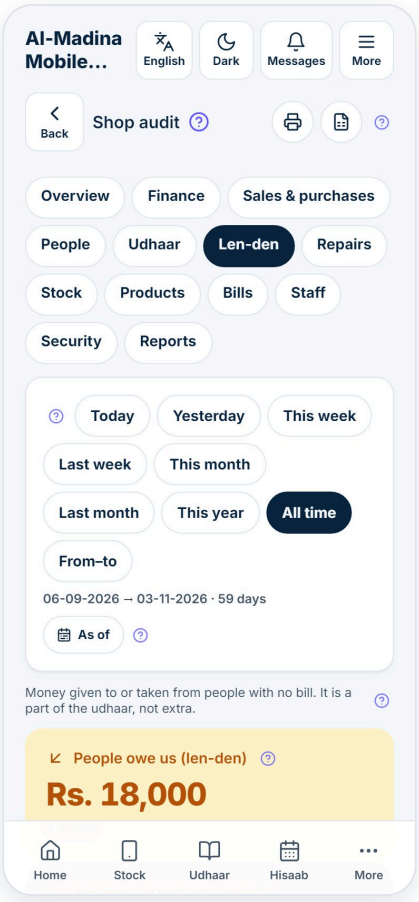

Picture 45: Udhaar: people owe us, we owe people

- **People owe us** and **We owe people**, kept apart, each with the start, now, the number of people and what is overdue.
- **Of which len-den**: the part of the udhaar that is len-den. It is inside the total, not extra.
- How the khatas moved in the period: udhaar given, received, taken, paid, returns, len-den given and taken, opening balances.
- **Age of each debt**, counted from the oldest unpaid bill, in age bands.
- **Overdue**: only bills that carried a promised date ("Promised to pay by" on the sale) can be overdue. A bill with no date only shows its age; it is never called overdue.
- The people and the phones on unpaid bills.

> **Tip:** Sort by age once a week. A debt older than 90 days needs a phone call today, not next month.

Len-den

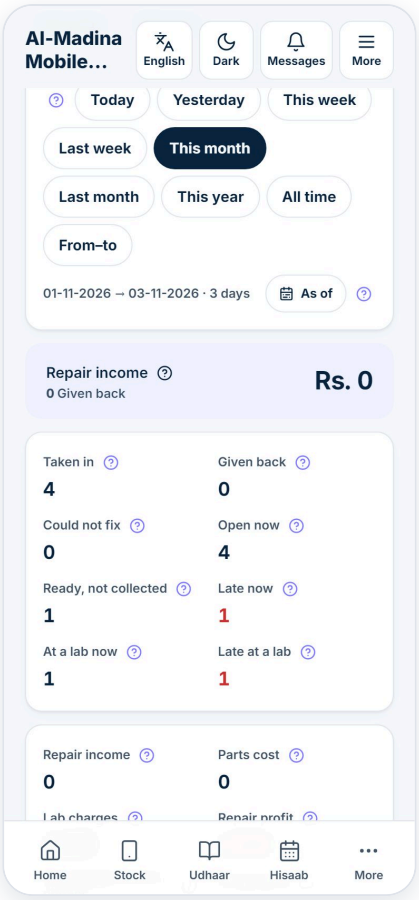

Picture 46: Len-den in the shop audit

This tab shows money given to or taken from people with no bill (chapter 17):

- **People owe us (len-den)** and **We owe people (len-den)**: what is still open now (or on the As of day), and how many people.
- Len-den given and taken in the period, compared with the period before.
- How much was later adjusted against bills, and how many entries were cancelled (nothing is deleted).
- A chart by day, week or month; a split by method (cash, bank, Easypaisa and so on).
- **Return dates**: entries with a date, late first: Late, Today, In 3 days, Later.
- **Len-den by person**: each person's given and taken, their whole khata and what is still open.
- Every entry of the period with its number, date, who entered it and the note.

Repairs and labs

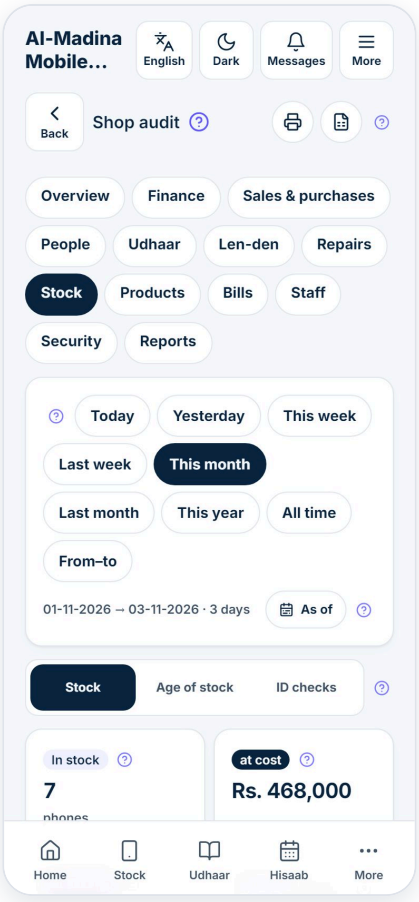

Picture 47: Repairs in the shop audit

- Counts: **Taken in**, **Given back**, **Could not fix**, **Open now**, **Ready, not collected**, **Late now**, **At a lab now** and **Late at a lab**.
- Money: **Repair income**, **Parts cost**, **Lab charges**, **Repair profit**, lab charges on the shop's own phones, and the average bill.
- A chart over the period, each repair lab with its record, what needs a look now, and the most common problems.

Example: you see "Ready, not collected 6". Tap it, and call those six customers. That is money and shelf space waiting at your counter.

Stock and ageing

Picture 48: Stock in the shop audit

Stock has three parts:

- **Stock**: phones in stock now (or on the As of day) by condition, PTA status, ID check, type and brand; value **at cost** and at asking price; the expected margin; the most expensive phones and the ones with the thinnest margin.
- **Age of stock**: phones in age bands (Fresh, Normal, Slow, Attention and older) using your own limits from Settings → **Stock audit thresholds**. Alerts point out dead stock, high-value phones that are slow, thin margins, phones with no asking price, ID checks still pending, and phones that came back more than once.
- **ID checks**: how many checks were done, and every check that was skipped, with who skipped it, for which phone and supplier, and why. A skipped check is never counted as a completed one.

Products, Bills and Staff

- **Products**: what sold by model, brand or type: units, share, revenue, profit, margin, average price, average days to sell, returns and stock left, marked Top, Average or Low.
- **Bills**: every bill of the period by kind, status and employee, and everything that was cancelled, with who cancelled it and why.
- **Staff**: each employee's sales, money received, purchases and actions in the period. The owner also sees the security columns.

Security (owner only)

One feed of every bent number or rule: asking price changed, sold under asking or under cost, discounts, cancellations, stock adjustments, opening balances, skipped ID checks and wrong owner PINs. Each line says who, when, before and after, the reason and who approved it, with counts per employee.

Reports: the complete audit report

The **Reports** tab makes the **complete shop audit report**. Pick the sections you want, choose summary or detailed, and get it as **Print / PDF** or **Excel** (one sheet per section). The report states the period, the As of day, the currency and what is not recorded. Every single report is also listed here with its own download.

What the audit does not show

The audit only shows what the app records, and it says so plainly:

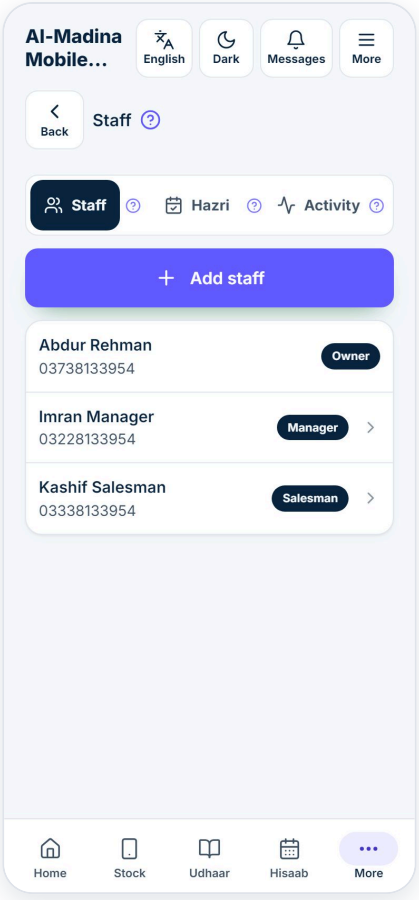

- **Due dates on bills** are not recorded unless you typed a promised date, so the app shows the age of a debt instead of calling it overdue.
- **Tax on purchases** is not recorded, so there is no input-tax figure.
- **Remittance fees** are only known if you typed them when the money came from abroad.
- Buying prices and profit are for the owner and manager only.

> **Important:** The audit never changes anything. It only reads. You can open it as often as you like, on any period, without any risk to your data.

22. Staff, roles and attendance

Each person who works in the shop should have their own login. Then every bill shows who made it, the owner can see what each person did, and each person only sees what their role allows.

Owner only: More → **Staff**.

Picture 49: Staff: the list with each role

The Staff screen has three tabs: **Staff**, **Hazri** (attendance) and **Activity**.

Add a staff member

Example: a new salesman, Kashif Mehmood.

1. Tap **Add staff**.
2. **Name**: `Kashif Mehmood`. This name prints on the bills he makes.
3. **Mobile number**: `3005550707`. This is his login.
4. **Password**: at least 6 characters.
5. **Quick PIN (4-6 digits)**, for example `4321`, for fast login on his own phone.
6. **Role**: **Salesman**.
7. Tap **Save**.

Tap a staff member later to change the **Role**, set a **New password**, or **Disable** / **Enable** him. A disabled person cannot log in, but everything he did stays in the records.

> **Tip:** When someone leaves the shop, disable him the same day. Never share one login between two people.

The four roles

There are four roles: **Owner**, **Manager**, **Salesman** and **Technician**. There is one owner per shop.

What the person can do	Owner	Manager	Salesman	Technician
Sell, add stock, take returns	Yes	Yes	Yes	No
Money received / paid, len-den	Yes	Yes	Yes	No
See buying price and profit	Yes	Yes	No	No
Sell below the buying price	Yes	Yes	No	No
Cancel bills and payments	Yes	Yes	No	No
Add expenses, close the day	Yes	Yes	No	No
Profit & reports, shop audit	Yes	Yes	No	No
Security feed in the audit	Yes	No	No	No
Take a phone in for repair	Yes	Yes	Yes	No
Work on repairs	Yes	Yes	No	Yes
Edit brands and models	Yes	Yes	No	No
Staff, shop settings, software fees	Yes	No	No	No
Override a blocked ID check	Yes	No	No	No

The salesman and the technician still see their own day's work.

Which role for a salesman who must not see profit?

Choose **Salesman**. A salesman can sell, add stock, take returns and take money in and out, but he never sees buying prices, profit, the reports or the shop audit. When he tries to sell under the buying price, the app stops him and asks for the owner or manager.

Choose **Manager** only for a person you trust with the whole business, for example a brother or a partner who runs the shop when you are away.

> **Tip:** In Settings → **Price rules** you decide who may sell under the asking price and who may change it: anyone, only owner / manager, or staff with the owner's PIN typed on the spot. Every approval is recorded.

Hazri (attendance)

When the **Staff attendance (hazri)** module is on, Home shows a **Hazri** card for everyone.

1. When you arrive, tap **Check in**.
2. When you leave, tap **Check out**.
3. The card then shows something like "In 9:05 AM · Out 7:10 PM · 10.1 h".

One check-in per day. The owner opens Staff → **Hazri**, picks the period, and sees for each person: today's status, hours worked, and the count of **Present**, **Half day**, **Leave**, **Absent** and **No record**. Tap a person to mark a day by hand, for example yesterday = Leave, note "Eid". Salary and advances are paid through **Expenses** (categories **Salary** and **Staff advance**).

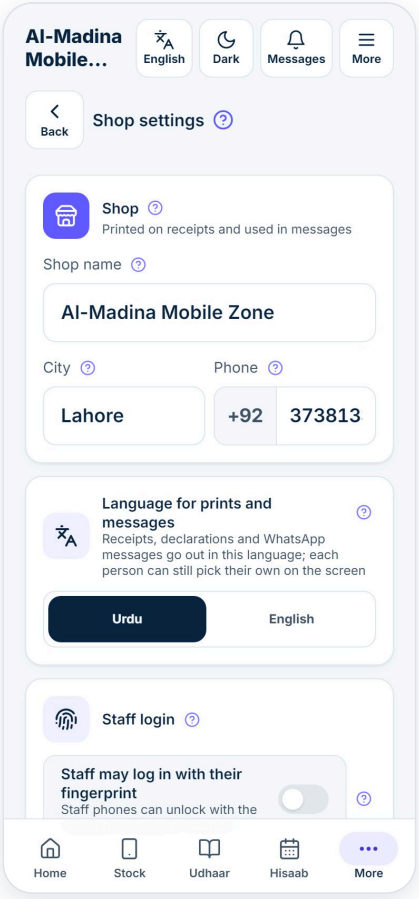

Activity: what each person did

Staff → **Activity** shows, for the chosen period, each person's **Sales (n · Rs)**, **Received (Rs)**, **Purchases (n · Rs)**, **Expenses (Rs)**, **Repairs** and the number of **Actions**, with their **Last login**. Tap a person to see the full log: every bill, payment, purchase, expense, repair, cancellation and settings change, with the time, number and amount. This comes from the record the app keeps of every change, so nothing can be left out.

23. Settings, business profile and WhatsApp messages

Shop settings

Owner only: More → **Shop settings**. The screen is made of cards, one per topic.

Picture 50: Shop settings

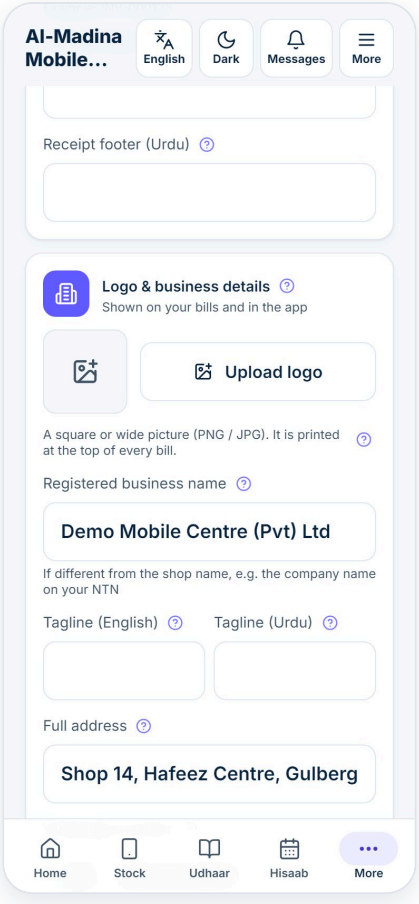

- **Shop**: **Shop name**, **City** and **Phone**. Printed on receipts and used in messages.
- **Language for prints and messages**: **Urdu** or **English**. Receipts, declarations and WhatsApp messages go out in this language. Each person can still choose their own screen language.
- **Staff login**: **Staff may log in with their fingerprint** instead of the PIN.
- **Sales tax**: switch on **Charge sales tax**, then set **Tax rate %**, **Prices include tax**, **NTN** and **STRN**. It is off by default and ticked on a bill when needed.
- **Receipt**: the **Invoice prefix** (an example shows, such as `INV-000123`), the **Receipt footer** and **Receipt footer (Urdu)**, for example "No return after 7 days".
- **Sticker cost code**: a 10-letter code word so only you can read the buying price on a price sticker.
- **Price rules**: who may sell under the asking price and who may change it.
- **Stock audit thresholds**: where the stock-age bands end, what counts as high value and as a thin margin.

- **Item settings**: stock valuation (weighted average or FIFO), whether selling past zero stock is allowed, and how many pieces are in a dozen, box or carton.
- **Device settings**: whether used mobiles also need the lock check, and the grades you use for used units.
- **Barcode settings**: the type of barcode for new stock. Old labels keep working.

When you change anything, a **Save** bar appears above the bottom tabs with "Not saved yet". Tap it and **Saved** confirms the change.

Business profile: logo and details on your bills

In the same Shop settings, the **Logo & business details** cards control how your printed bills look.

Picture 51: Logo and business details

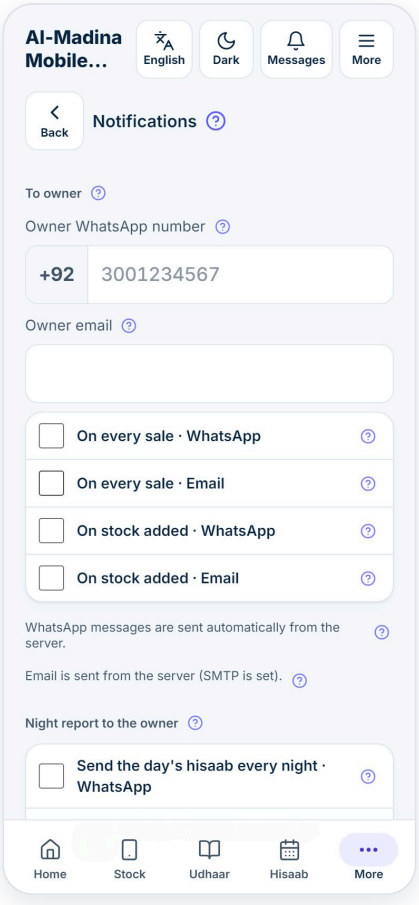

1. Tap **Upload logo** and choose a square or wide picture (PNG or JPG). It is printed at the top of every bill. **Change logo** or **Remove logo** later if needed.
2. Fill **Registered business name** if it differs from the shop name (for example the company name on your NTN), the **Tagline (English)** and **Tagline (Urdu)**, **Full address**, **WhatsApp number**, **Email**, **Website / page**, **Business type**, **Province** and **Opening hours** (for example "11 am – 10 pm, Friday closed").
3. **Owner details**: the owner's name and CNIC.
4. **Tax registration (FBR)**: NTN, STRN and the **FBR POS registration ID** (only if you are in FBR's point-of-sale scheme). They are printed on bills when filled.

5. **Currency**: money is always Pakistani rupees, but you choose how it is written: the **Sign** (Rs., Rs, PKR and so on), **Where the sign goes** (**Before (Rs. 500)** or **After (500 PKR)**), and **Rupees only** or **Always show paisa (.00)**. The **Looks like** preview shows the result.
6. **Printed bill**: tick what appears on sale bills and repair slips: **Logo**, **Tagline**, **NTN / STRN / FBR POS ID**, **Owner's name**, **Bank / wallet details (for paying a balance)**, **Terms (returns / warranty)** and social pages. Write the **Terms (English)** and **Terms (Urdu)** and your bank and Easypaisa / JazzCash details here. **QR code to see the bill online** (on at the start) prints the QR described in chapter 8.
7. Tap **Save** on the Save bar.

> **Tip:** Put your Easypaisa number on the bill (Printed bill → Bank / wallet details). Customers who buy on udhaar then know exactly where to send the money.

WhatsApp messages and notifications

More → **Notifications** controls what the app sends and to whom.

Picture 52: Notifications and the night report

- **To owner**: the **Owner WhatsApp number** and **Owner email**. Tick **On every sale** and/or **On stock added**, by WhatsApp or email.
- **Night report to the owner**: the day's hisaab every night (chapter 16).

- **Udhaar reminders**: **Remind customers automatically** after the account has sat for a number of days. Installment and len-den reminders follow this switch too.

The screen tells you how messages are sent:

- "WhatsApp messages are sent automatically from the server." means your software provider has set up the WhatsApp Business service; messages go by themselves.
- Otherwise messages open in WhatsApp for you to send with one tap. They wait in **Messages** (the bell at the top of every screen) where you can open each and **Mark sent**.
- "Email is sent from the server (SMTP is set)." means emails go by themselves. If email is not set up, ask your software provider; until then email messages wait in the list.

Messages to customers (receipts, reminders) use the shop's language from **Language for prints and messages**.

Language, theme and look

- **Language**: tap the language button at the top of any screen and pick **اردو**, **Roman Urdu** or **English**. The app shows one language at a time; Urdu reads right to left. Numbers are always 0–9.
- **Dark / Light**: tap **Dark** (or **Light**) at the top. More → **Appearance** also has **System**.
- **Look**: More → **Look** gives four styles: **Modern**, **Professional**, **Navy** and **Colorful**.
- Every screen has small **?** buttons. Tap one for a short explanation with an example; each explanation has its own English / Urdu / Roman switch.

FBR Digital Invoicing (for shops registered for sales tax)

If FBR asks your business to report its invoices (sales-tax registered, notified by FBR), the app can send every sale bill to FBR by itself and print the FBR number and its QR code on the bill.

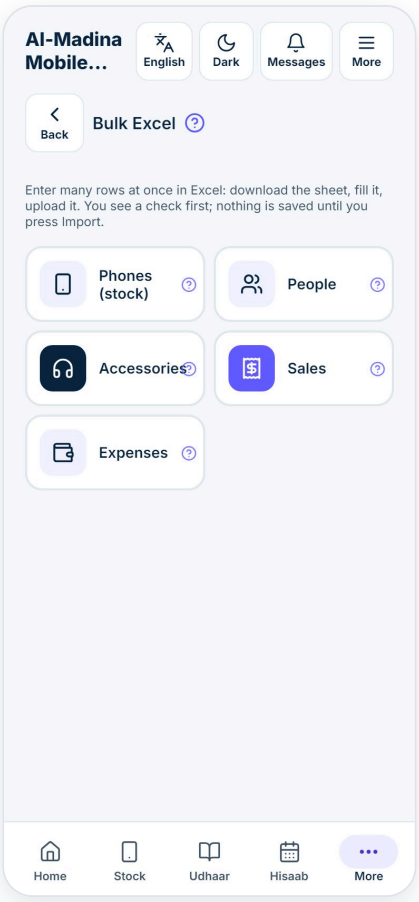

1. Make sure your **NTN** and **STRN** are filled in under **Tax registration**.
2. In IRIS (FBR's portal) get the **Digital Invoicing security token** (first the sandbox / test token).
3. Open **More → Shop settings → FBR Digital Invoicing**, paste the token, choose **Sandbox (test)** and tap **Save**.
4. Tap **Test with FBR**. When it says FBR accepted the test bill, turn on **Send bills to FBR** and **Save**.
5. After a few good bills, switch to **Production (live)** with the production token.

From then on, every sale goes to FBR right away. If the internet or FBR is down, the bill waits and goes by itself later. The bill page shows **FBR number**, **Waiting**, or **FBR turned this bill down** with the reason and a **Send again** button.

> **Important:** The token is kept locked on the server and is never shown again. Ask your tax adviser to confirm the sale type and HS code for phones, other devices and items in the same card.

24. Bulk Excel import and export

When a shop moves from a register or another software, nobody wants to type 300 phones one by one. **Bulk Excel** lets you fill an Excel sheet and bring all rows in at once. Owner and manager only: More → **Bulk Excel**.

Picture 53: Bulk Excel: pick what to bring in

Import step by step

Example: you have 120 phones in the shop and 45 customers in your old udhaar register.

1. Pick what you are bringing in: **Phones (stock)**, **People**, **Accessories**, **Sales** or **Expenses**. Start with **People**, then **Phones (stock)**.
2. Tap **Download the sheet**. It opens in Excel with three sheets: **Data** (the only one you fill), **Help** (every column explained, required or not) and **Lists** (your brands, models, colours, suppliers and categories for the dropdowns).
3. The first three rows of Data are yellow sample rows, for example a Vivo Y21 128 GB at Rs. 35,000. Write your rows under them or over them. Samples are recognised and skipped, so nothing is ever created from a sample.
4. Fill it. Dates as `dd-mm-yyyy`, money in plain rupees (`35,000` is fine), and words like condition, PTA or type from the dropdown. Typed words are understood too: *New*, *Box pack*, *Used*, *PTA*, *Non-PTA*, *JV*, *Customer*, *Supplier*, *They owe us*. A CSV file works as well.

5. Upload the file. Every row comes back marked **ok**, **note** (something will be created, like a new brand or a new person), **error** (with the reason in plain words, such as "IMEI must be 15 digits" or "Asking price is below cost") or **skipped** (a sample or an empty line). **Nothing is saved yet.**
6. Fix the errors in Excel and upload again, or tick **Skip rows with errors, import the rest**.
7. Tap **Import**. Either every good row is saved, or nothing is. The result tells you what was made (phones, purchase bills, people, opening balances and so on).

> **Note:** If you upload the same file twice, the app warns you, so stock is not entered double.

What each sheet does

- **Phones (stock)**: one row per phone. Leave the supplier blank for your own old stock. Give a supplier phone number and the rows become a purchase bill per supplier and date, with the paid amount against it and the rest on the supplier's khata. Non-PTA and JV phones need the SIM time.
- **People**: name, phone and type are enough. An **opening balance** with who owes posts the start of the khata. A phone number already in your khata is skipped.
- **Accessories**: name, quantity in hand, unit cost and sale price. The code (SKU) is made for you if left blank.
- **Sales**: only phones already in stock in the app, by IMEI. If money stays on khata, the customer's phone number is needed. Selling under cost is refused unless the owner or manager allows it.
- **Expenses**: date, category, amount and account (Cash unless you name a bank or wallet).

Every imported row goes through the same steps as the counter, so the khata, ledger and phone history are complete, exactly as if you had typed each one.

Export: download my data

Download my data on the same page gives your current phones, people, accessories, sales or expenses in exactly the same layout. You can correct things in Excel and bring the file back. Earlier imports are listed at the bottom with who did them and what they made.

25. Software fees, backup and the PC version

Your plan and paying the fee

Owner only: More → **Software fees**.

- **Your plan**, the **Monthly fee** and **Paid until**.
- **Pay into one of these**: the software provider's accounts (Easypaisa, JazzCash, SadaPay, bank), each with a **Copy** button for the number.

To pay:

1. Send the fee from your own Easypaisa, JazzCash or bank app.
2. In Software fees, fill **I have paid**: **Amount (Rs)**, **Months**, **Paid through**, the **Transaction ID / reference**, and **Add a screenshot**.
3. Tap **Send**.

Your payments shows each payment as **Being checked**, **Received** or **Not accepted** (with the reason). Once it is received, your **Paid until** date moves forward, you see "Thank you! Your plan is renewed", and you can print the receipt.

Renewal code: sometimes, especially for the PC version without internet, the provider sends a code on WhatsApp. Paste it in **Renewal code** and tap **Renew with code**. It works without internet, but only once.

Fee still to pay

Sometimes the software provider extends your package before you pay (you agreed on the phone). Then **Software fees** shows **Fee still to pay**: each line has its number (for example `FEE-0001`), the period, the months and the fee, with **Not paid**, **Part paid** or **Paid**. Below it, **Still to pay** shows the total in red. If a day to pay was agreed, it shows **To pay by** with the date, or **Was to be paid by** once that day has passed.

- **Fee invoice** opens the invoice to print or keep: each period, the fee, what you paid, what is left, and where to pay.
- When you send money, it first clears the fee still to pay, oldest first; the rest moves your **Paid until** date forward. The amount in **I have paid** already includes what is still to pay.
- In **Your payments**, a payment shows **Went to earlier fee** with the part that cleared it. The receipt shows it too.
- The reminder window also shows "Fee still unpaid from before".

Example: the provider gave 2 months for Rs. 3,000 on the 9th, to pay by the 15th. You send Rs. 1,000: the line shows **Part paid**, Rs. 2,000 still to pay. Next you send Rs. 3,500: Rs. 2,000 clears the old fee (**Paid**) and Rs. 1,500 buys one more month.

Fee reminders

The app reminds you politely before the plan ends:

When	What you see
7 days left	A yellow bar at the top
3 days left	An orange bar, and a reminder window once a day
1 day left and the last day	A red bar, and the reminder window more often
Plan ended, grace days (normally 7)	A red bar: everything still works
After the grace days	View-only mode (see below)
Payment sent, not yet checked	A calm blue bar: "Payment received, verification pending."

The reminder window shows the plan, the end date, the fee, where to pay (with **Copy** buttons) and three buttons: **Pay fee now**, **Remind me later** (in 4 hours, tomorrow or in 3 days) and **Close**. It is the one screen that shows English, Urdu and Roman Urdu together. It never opens in the middle of a sale, a payment or any form. Staff see only a short line asking them to inform the owner.

What happens if the fee is not paid

Nothing is ever deleted. After the grace days the app goes into view-only mode:

- You can still log in and see all your data.
- You can still download every report and list, and take a backup.
- You can still pay the fee.
- New sales and purchases are paused until the fee is paid.

The moment the payment is approved (or a renewal code is pasted), everything opens again exactly as it was.

Backup my data

In Software fees (and in the reminder window) tap **Backup my data**. It downloads every list (stock, khata, sales, purchases, expenses, accessories and more) as Excel files in one zip. It works any time, even when the plan has ended.

> **Tip:** Make it a habit: on the 1st of every month, tap **Backup my data** and keep the zip on your computer or Google Drive.

Working without internet

If the market's internet drops, keep selling. A sale, purchase, payment or expense made without internet is saved on the phone, and the strip under the header says "Saved on this phone. It will be

sent when the internet is back." When the connection returns, they are sent by themselves, in order, each only once. Bill numbers are given when they reach the server. Reports, downloads and WhatsApp sending need the internet.

The PC version (no internet needed)

Shops without reliable internet can run the same software on a Windows computer:

1. Install **MobileShop-Setup.exe** (your software provider gives it to you).
2. Open **Mobile Shop** from the Desktop. A small icon appears near the clock, and the app opens in the browser.
3. Create the shop account once, then work as usual.

Everything is stored on that computer. The small icon's menu has **Backup now** (a dated copy, also placed on the Desktop), **Open data folder** and **Quit**. Phones on the shop's Wi-Fi can also open it; ask your software provider to set this up. To update, run the new Setup; your data stays.

> **Important:** On the PC version your data lives on one computer. Take **Backup now** every evening and copy it to a USB stick or Google Drive at least once a week.

26. Common questions and troubleshooting

A customer says his balance is wrong. Open his page from the Udhaar khata and go through **Khata history** with him. Every line has a date, a bill number and the running balance. Send the PDF statement on WhatsApp.

I entered a payment twice. Open one of them and cancel it with a reason. The balance is corrected by a reversing entry, and the cancelled one stays visible, crossed out.

A friend borrowed money from me. Do I use Money received / Money paid? No. Use **Gave money (len-den)** and **Took money (len-den)** on his page (chapter 17). Money received and Money paid are for bills.

Left in hand is minus but I sold well today. You probably bought stock or gave back money on a return. Look at the chips under **Went out**. The money spent on stock is now phones on your shelf.

My galla count does not match Expected in drawer. Check whether an online payment was entered as **Cash**, or an expense was paid from the galla but not entered. Payments by Easypaisa or bank should always be **Online**.

Profit shows a loss this month. Open the Profit report. Look at **Returned by customers** and the expense lines. A large return or rent paid in this month can turn the month into a loss. The shop audit's Finance tab shows the same with the period before for comparison.

My salesman should not see profit. Give him the **Salesman** role (More → Staff → his name → Role). He can sell and take money but never sees buying prices, profit or reports.

I cannot find Expenses, Reports or the Shop audit. They are for the owner and manager. If you are the owner and still do not see a feature, it may be a module that is not in your plan; ask your software provider.

The WhatsApp reminder did not go by itself. Automatic sending needs the WhatsApp Business service set up by your software provider. Without it, open **Messages** (the bell) and tap each message to send it from WhatsApp.

The night report did not arrive. Check More → **Notifications**: the owner's number is written, **Send the day's hisaab every night** is ticked, and the time is set. Tap **Send today's hisaab now** to test.

The installment customer paid half. Open the plan, tap **Take installment** and change the amount to what he paid. The installment shows **Part** until the rest comes.

The Bulk Excel upload shows errors. Tap a red row to read the reason ("IMEI must be 15 digits", "Say who owes" and so on). Fix it in Excel and upload again, or tick **Skip rows with errors, import the rest**. Nothing is saved until you press **Import**.

My logo does not show on the bill. Check Shop settings → **Printed bill**: **Logo** must be ticked. Use a clear PNG or JPG, and tap **Save** on the Save bar.

The fee reminder keeps coming back. Pay the fee and tap **I have paid** with the transaction ID. The bar turns blue ("Payment received, verification pending") and the reminders stop.

My plan ended. Is my data gone? No. Nothing is ever deleted. You can view everything, download it and take a backup. New sales open again the moment the fee is received.

I forgot my password or PIN. PIN: tap **Forgot PIN? Use password**. Password: staff ask the shop owner (More → Staff → name → **New password**). The owner asks the software provider.

Print or download in the Android app opens Chrome. That is normal: Chrome shows the print screen or saves the file. If it says the link has expired, go back and tap Print or Download again.

The internet went off during a sale. Carry on. The sale is saved on the phone and sent when the internet returns. If one cannot be sent (for example the same phone was sold from another device), it shows in red with the reason; fix it and tap **Try again**.

Glossary

Word	Meaning
Udhaar	Credit: goods given now and paid later, or money you still owe someone.
Khata	A person's account page: everything sold, bought, paid and received, with the balance.
Len-den	Money given to or taken from a person with no bill, kept in their khata.
Qist	One monthly installment of a phone sold on installments.
Zamin	The guarantor who signs for an installment customer.
Amanat	A phone given on trust to another shop to show or sell; it stays yours until sold or returned.
Galla	The cash drawer at the counter.
Hisaab	The account of a day or a period: what came in, what went out, what is left.
Left in hand	Money that came in minus money that went out in the period. Not the same as profit.
Real profit	Profit on sales plus other income, minus expenses.
Owner drawing	Money the owner takes for himself; not a shop expense.
Close the day	Counting the galla at night and comparing it with what the app expects.

Word	Meaning
Asking price / Cost price	What you want to sell a phone for / what you paid for it.
IMEI	The 15-digit number of a phone (dial `*#06#`). Dual-SIM phones have IMEI 1 and IMEI 2.
CNIC	Pakistani national identity card number, 13 digits (12345-1234567-1).
PTA	Pakistan Telecommunication Authority. A **PTA approved** phone works with Pakistani SIMs.
Non-PTA	A phone not registered with PTA; a local SIM works only for a limited time (SIM time).
JV	A phone patched to get around PTA; it also has a SIM time and is higher risk.
Box pack / Open box / Used / Patched	The condition of a phone.
eGadget	The Punjab Police portal to check if a phone's IMEI is reported stolen.
NTN / STRN	National Tax Number and Sales Tax Registration Number from FBR.
FBR	Federal Board of Revenue, Pakistan's tax authority.
Grace days	The days after the plan ends when the app still works fully.
View-only mode	After the grace days: you can see, download and back up, but not make new bills.
